

Hospital Comments, 3Q2005

=====

General Comments on 3rd Quarter 2005 Data

The following general comments about the data for this quarter are made by THCIC and apply to all data released for this quarter.

. Data are administrative data, collected for billing purposes, not clinical data.

. Data are submitted in a standard government format, the 837 format used for submitting billing data to payers. State specifications require the submission of additional data elements. These data elements include race and ethnicity. Because these data elements are not sent to payers and may not be part of the hospital's standard data collection process, there may be an increase in the error rate for these elements. Data users should not conclude that billing data sent to payers is inaccurate.

. Hospitals are required to submit the patient's race and ethnicity following categories used by the U. S. Bureau of the Census. This information may be collected subjectively and may not be accurate.

. Hospitals are required to submit data within 60 days after the close of a calendar quarter (hospital data submission vendor deadlines may be sooner). Depending on hospitals' collection and billing cycles, not all discharges may have been billed or reported. Therefore, data for each quarter may not be complete. This can affect the accuracy of source of payment data, particularly self-pay and charity categories, where patients may later qualify for Medicaid or other payment sources.

. The Source of Admission data element is suppressed if the Type of Admission field indicates the patient is newborn. The condition of the newborn can be determined from the diagnosis codes. Source of admission for newborns is suppressed indefinitely.

. Conclusions drawn from the data are subject to errors caused by the inability of the hospital to communicate complete data due to reporting form constraints, subjectivity in the assignment of codes, system mapping, and normal clerical error. The data are submitted by hospitals as their best effort to meet statutory requirements.

PROVIDER: University of Texas M D Anderson Cancer Center
THCIC ID: 000105
QUARTER: 3
YEAR: 2005

Certified with comments

THCIC Intro

The University of Texas M.D. Anderson Cancer Center is one of the nation's first three comprehensive Cancer Centers designated by the National Cancer Act and remains one of only 36 such centers today that meet the rigorous criteria for NCI designation. Dedicated solely to cancer patient care, research, education and prevention, M.D Anderson was also named the best cancer center in the United States by the U.S. News & World Report's "America's Best Hospitals" survey for four out of the past five years. As such, it was the only hospital in Texas to be ranked number one in any of the 17 medical specialties surveyed.

Because M.D. Anderson consults with, diagnoses and treats only patients with cancer, it is important in the review of these data that key concepts about cancer and patient population are understood. Such information is vital to the accurate interpretation and comparison of data.

Cancer is not just one disease. Rather, it is a collection of 100 or more diseases that share a similar process. Some forms of the disease are serious and life threatening. A few pose little threat to the patient, while the consequences of most cancers is in between.

No two cancers respond to therapy in exactly the same way. For example, in order to effectively treat a breast cancer, it must be staged according to the size and spread of the tumor. Patients diagnosed with Stage I and Stage IV breast cancer may both receive radiation therapy as treatment, but two distinctive courses of treatment and doses are administered, dependent on the stage of the disease. Even two Stage I breast cancers can respond differently to the treatment.

M.D. Anderson treats only patients with cancer and their related diseases. As such, the population is comparable to a total patient population of a community hospital, which may deliver babies, perform general surgery, operate a trauma center and treat only a small number of cancer patients.

Congress has recognized M.D. Anderson's unique role in providing state of the art cancer care by exempting it from the DRG-based inpatient prospective payment system. Nine other freestanding NCI designated cancer centers are also exempt.

Because M.D. Anderson is a leading center for cancer research, several hundred patients may be placed on clinical trials every year, rather than -- or in addition to -- standard therapies. Highly regulated and monitored, clinical trials serve to improve conventional therapies and provide new options for patients.

Patients often come to M.D. Anderson for consultation only. With M.D. Anderson physicians consulting with their hometown oncologists, patients often choose to get treatment at home rather than in Houston.

More than half of M.D. Anderson's patients has received some form of cancer treatment before coming to the institution for subsequent advice and treatment.

Hospital Comments, 3Q2005

This proportion is far higher than in general hospitals, making it difficult to compare M.D. Anderson to community facilities.

As a public institution, M.D. Anderson welcomes inquiries from the general public, advocacy organizations, the news media and others regarding this data. Inquiries may be directed to Julie Penne in the Office of Communications at 713/792-0655.

=====

PROVIDER: St Joseph Regional Health Center
THCIC ID: 002001
QUARTER: 3
YEAR: 2005

Certified with comments

Data Source - The data included in this file is administrative, not clinical research data. Administrative data may not accurately represent the clinical details of a patient visit. This data should be cautiously used to evaluate health care quality and compare outcomes.

Charity Care - This data does not accurately reflect the number of charity cases for the time period. Charity and self-pay patients are difficult to assign in the data submitted to the state. We are not able to classify a patient account as "charity" until after discharge when other potential payment sources have been exhausted. Because of this, charity care is combined with the Self Pay category. The amount of charges forgone for St. Joseph Regional Health Center charity care, based on established rates for the first three quarters of 2005 was \$22,847,982.

Patient Mix - All statistics for St. Joseph Regional Health Center include patients from our Skilled Nursing, Rehabilitation, and Acute Care populations. Our Skilled Nursing and Rehabilitation units are long-term care units. Because of this Mortality and Length of Stay may be skewed. This will prohibit any meaningful comparisons between St. Joseph Regional Health Center and any "acute care only" facilities.

Physicians - All physician license numbers and names have been validated as accurate but some remain unidentified in the THCIC Practitioner Reference Files. Mortalities reported may be related to physicians other than the attending Physician. The attending physician is charged with the procedures requested or performed by the consulting or specialist physicians.

Diagnosis and Procedures - Data submitted to the state may be incomplete for some patients due to the limitation on the number of diagnosis and procedure codes allowed. The data is limited to nine diagnoses codes and six procedure codes per patient visit.

Cost and Charges - The state requires that we submit revenue information including charges. It is important to note that charges do not reflect actual reimbursement received, nor do they reflect the actual cost of providing the services. Typically actual payments received are much less than the charges due to managed care-negotiated discounts, denial of payment by insurance companies, contractual allowances, as well as charity and un-collectable accounts. The relationship between cost of care, charges, and the revenue a facility receives is extremely complex. Comparing costs of care from one hospital to the next may result in unreliable results.

Severity Adjustment - THCIC is using the 3M APR-DRG grouper to assign the APR-DRG (All-Patient Refined Diagnoses Related Grouping) severity and risk of mortality scores. The assignment is made by evaluation of the patient's age, sex, diagnosis codes, procedure codes, and discharge status. This grouper can only use the limited number of procedure and diagnosis codes available in the data file (nine diagnoses and six procedure

Hospital Comments, 3Q2005

codes). If all the patient's diagnosis codes were available the APR-DRG assignment may possibly differ from the APR-DRG assigned by THCIC. The severity grouping assignment performed by the state using the APR-DRG grouper cannot be replicated by facilities unless they purchase this grouper.

Additionally, the lack of education regarding how this grouper calculates the severity adjustments or how it functions can greatly impact the interpretation of the data.

PROVIDER: CHRISTUS St Joseph Hospital
THCIC ID: 015001
QUARTER: 3
YEAR: 2005

Certified with comments

Christus St. Joseph Hospital certified the data, but could not account for 88 patients due to processing the patients after the data was submitted.

During this time period Christus St. Joseph Hospital provided charity care for 245 patients with total charges (-\$2,659,902.56) dollars. The system didn't identify these patients.

Christus St. Joseph data didn't correspond to the newborn admissions, according to our data there 87 premature infants, 238 sick infants and 792 normal newborns.

=====

PROVIDER: Baylor Medical Center-Garland
THCIC ID: 027000
QUARTER: 3
YEAR: 2005

Certified with comments

Submission Timing

Baylor estimates that our data volumes for the calendar year time period submitted may include 96% to 100% of all cases for that time period. The state requires us to submit a snapshot of billed claims, extracted from our database approximately 20 days following the close of the calendar year quarter. Any discharged patient encounters not billed by this cut-off

date will not be included in the quarterly submission file sent in.

Physician Identification

All physician license numbers and names have been validated as accurate against a physician reference file that is derived from information provided by the Texas Board of Medical Examiners. Those physicians not yet assigned a state license number at the time of data submission are given temporary numbers by the hospital for state reporting purposes. Due to the "lag" time between when the physician is licensed and when THCIC receives the information, some physicians may remain unidentified in the THCIC Practitioner Reference Files.

The THCIC minimum data set houses only two (2) physician fields; Attending Physician and Operating or Other Physician (if applicable) as reflected on the UB92 billing document. Mortality rates, case costs and other data calculated for this population of physicians may be misrepresentative. Due to the complexity of most inpatient admissions many physicians provide care to patients throughout an admission. Consulting physicians may prescribe and treat patients on behalf of the physician listed as the attending physician. Analysis of this physician information should carefully consider that significant variations in case count, case cost, and mortality may not be directly related to the care provided by the attending physician, but also reflect the varied use of consultants.

While hospitals document many treating physicians (surgeons and consultants) for each case, THCIC maintains only one (1) additional physician per case besides the Attending. "Other" physician case volumes, mortality, case costs and LOS, will frequently be inaccurate because of this limitation. Surgeons and consulting physicians beyond one that may have been involved on a case will not be credited with providing care for that patient. Analysis of "other physician" information should, therefore, take into consideration that a significant portion of treating physicians are excluded from the patient cases.

Diagnosis and Procedures

Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD-9-CM. This is mandated by the federal government and all hospitals must comply.

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code as many as 25 diagnoses and 25 procedures for each patient record. One limitation of using the ICD-9-CM system is that there does not exist a code for every possible diagnosis and procedure due to the continued evolution of medicine; new codes are added yearly as coding manuals are updated.

Race/Ethnicity

There are no national standards regarding patient race categorization so hospitals may not have the same designations from which patients can choose. The state has recently attempted to standardize a valid set of race codes for this project but these are not universally used by all hospitals. Each hospital must independently map their specific codes to the state's race code categories. This mapping may not be consistent across hospitals. Thus epidemiology analysis of these two data fields does not accurately describe the true population served by the hospital.

Standard Source of Payment

The standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement each payer identification must be categorized into the appropriate standard source of payment value. It should also be noted that the primary payer associated to the patient's encounter

Hospital Comments, 3Q2005

record may change over time. With this in mind, approximately 5% of the primary payers originally categorized as "Blue Cross" were recategorized as "Managed Care", 47% categorized as "Commercial" were recategorized as "Managed Care", 2% originally categorized as "Medicaid" were recategorized as "Medicare" and 4% originally categorized as "Blue Cross" were recategorized as "Medicare". Also 3% of the secondary payers originally categorized as "Missing/Invalid" were recategorized as "Medicare", 3% categorized as "Commercial" were recategorized as "Self-Pay", 5% originally categorized as "Blue Cross" were recategorized as "Managed Care" and 2% originally categorized as "Commercial" were recategorized as "Managed Care".

Additionally, those payers identified contractually as both "HMO and PPO" are categorized as "Commercial PPO". Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Cost/ Revenue Codes

The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to managed care-negotiated discounts and denial of payment by insurance companies. Charges also do not reflect the actual cost to deliver the care that each patient needs.

Certification Process

Given the current certification software, there is not an efficient mechanism to edit and correct the data. In addition, due to hospital volumes, it is not feasible to perform encounter level audits and edits. Within the constraints of the current THCIC process, the data is certified to the best of our knowledge as accurate and complete given the above comments.

PROVIDER: Madison St Joseph Health Center
THCIC ID: 041000
QUARTER: 3
YEAR: 2005

Certified with comments

Data Source - The data included in this file is administrative, not clinical research data. Administrative data may not accurately represent the clinical details of a patient visit. This data should be cautiously used to evaluate health care quality and compare outcomes.

Charity Care - This data does not accurately reflect the number of charity cases for the time period. Charity and self-pay patients are difficult to assign in the data submitted to the state. We are not able to classify a patient account as "charity" until after discharge when other potential payment sources have been exhausted. Because of this, charity care is combined with the Self Pay category. The amount of charges forgone for Madison St. Joseph Health Center charity care, based on established rates for the first three quarters of 2005 was \$ 199,123.21.

Patient Mix - All statistics for Madison St. Joseph Health Center include patients from our Skilled Nursing, and Acute Care populations. Our Skilled Nursing unit is a long-term care unit. Because of this Mortality and Length of Stay may be skewed. This will prohibit any meaningful comparisons between Madison St. Joseph Health Center and any "acute care only" facilities.

Physicians - All physician license numbers and names have been validated as accurate but some remain unidentified in the THCIC Practitioner Reference Files. Mortalities reported may be related to physicians other than the attending Physician. The attending physician is charged with the procedures requested or performed by the consulting or specialist physicians.

Diagnosis and Procedures - Data submitted to the state may be incomplete for some patients due to the limitation on the number of diagnosis and procedure codes allowed. The data is limited to nine diagnoses codes and six procedure codes per patient visit.

Cost and Charges - The state requires that we submit revenue information including charges. It is important to note that charges do not reflect actual reimbursement received, nor do they reflect the actual cost of providing the services. Typically actual payments received are much less than the charges due to managed care-negotiated discounts, denial of payment by insurance companies, contractual allowances, as well as charity and un-collectable accounts. The relationship between cost of care, charges, and the revenue a facility receives is extremely complex. Comparing costs of care from one hospital to the next may result in unreliable results.

Severity Adjustment - THCIC is using the 3M APR-DRG grouper to assign the APR-DRG (All-Patient Refined Diagnoses Related Grouping) severity and risk of mortality scores. The assignment is made by evaluation of the patient's age, sex, diagnosis codes, procedure codes, and discharge status. This grouper can only use the limited number of procedure and diagnosis codes available in the data file (nine diagnoses and six procedure

Hospital Comments, 3Q2005

codes). If all the patient's diagnosis codes were available the APR-DRG assignment may possibly differ from the APR-DRG assigned by THCIC. The severity grouping assignment performed by the state using the APR-DRG grouper cannot be replicated by facilities unless they purchase this grouper.

Additionally, the lack of education regarding how this grouper calculates the severity adjustments or how it functions can greatly impact the interpretation of the data.

=====

PROVIDER: Trinity Medical Center
THCIC ID: 042000
QUARTER: 3
YEAR: 2005

Certified with comments

This data is administrative data, which hospitals collect for billing purposes, and not clinical data in medical records, from which you can make judgements about patient care.

The state requires us to submit inpatient claims, by quarter year, gathered from a form called a UB92, in a standard government format called HCFA 1450 EDI electronic claim format.

Submission Timing

The hospital estimates that our data volumes for the calendar year time period submitted may include 96% to 100% of all cases for that time period.

The state requires us to submit a snapshot of billed claims, extracted from our database approximately 20 days following the close of the calendar year quarter. Any discharged patient encounters not billed by this cut-off date will not be included in the quarterly submission file sent in.

Diagnosis and Procedures

The data submitted matches the state's reporting requirements but may be incomplete due to a limitation on the number of diagnoses and procedures the state allows us to include for each patient. In other words, the state's data file may not fully represent all diagnoses treated by the hospital or all procedures performed, which can alter the true picture of the patient's hospitalization, sometimes significantly.

Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD-9-CM. This is mandated by the federal government and all hospitals must comply.

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code as many as 25 diagnoses and 25 procedures for each patient record. One limitation of using the ICD-9-CM system is that there does not exist a code for every possible diagnosis and procedure due to the continued evolution of medicine; new codes are added yearly as coding manuals are updated.

The state is requiring us to submit ICD-9-CM data on each patient but has limited the number of diagnoses and procedures to the first nine diagnoses codes and the first six procedures codes. As a result, the data sent by us does meet state requirements but cannot reflect all the codes in an individual patient's record may have been assigned. This means also that true total volumes may not be represented by the state's data file, which therefore make percentage calculations inaccurate (i.e. mortality percentages for any given diagnosis or procedure, percentage of patients in each severity of illness category). It would be obvious, therefore, those sicker patients (more diagnoses and procedures) are less accurately reflected by the 1450 format. It then stands to reason that hospitals, which treat sicker patients, are likewise less accurately reflected.

Specialty Services

The data submitted does not have any specific data field to capture unit of service or expand in the specialty service (such as rehabilitation) provided to a patient. Services used by patients in rehabilitation may be very different from those used in other specialties. The data is limited in its ability to categorize patient type.

Services utilized by patients in specialty units may be very different from those used in acute care. Conditions such as stroke and hip replacement typically require a lower level of care, a longer length of stay, and a different utilization of service.

Length of Stay

The length of stay data element contained in the state's certification file is only three characters long. Thus any patients discharged with a length of stay greater than 999 days will not be accurately stored within the certification database. It is rare that patients stay as long as or longer than 999 days, therefore, it is not anticipated that this limitation will affect this data. The hospital does have an inpatient rehabilitation unit whose patients stay an average of 12 days. This may skew the data when combined with other acute care patient stays.

Normal Newborns

The best way to focus on severity of illness regarding an infant would be to check the infant's diagnosis at discharge, not the admitting source code. The hospital's normal hospital registration process defaults "normal delivery" as the admission source. Other options are premature delivery, sick baby, extramural birth, or information not available. The actual experience of a newborn is captured elsewhere in the file, namely, in the ICD-9-CM diagnosis. Admission source does not give an accurate picture.

Race/Ethnicity

During the hospital's registration process, the registration clerk does routinely complete patient's race and/or ethnicity field. The race data element is sometimes subjectively captured and the ethnicity data element is derived from the race designation. There are no national standards regarding patient race categorization, and thus each hospital may designate a patient's race differently. The state has recently attempted to standardize a valid set of race codes for this project but these are not universally used by all hospitals. Each hospital must independently map their specific codes to the state's race code categories. This mapping may not be consistent across hospitals. Thus epidemiology analysis of these two data fields does not accurately describe the true population served by the hospital.

Cost/Revenue

The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges. Charges also do not reflect the actual costs to deliver the care that each patient needs.

Quality

Trending of data over a few years is important to define outcome and quality.

A small sampling of data (i.e. one year) does not explain outcome.

We recommend the Patient communicate with the Hospital and the Physician regarding data.

Patient and physician preference contributes to the care rendered to the patient and the data does not always reflect this.

Patients and physicians consider many factors when making health care decisions that are not available in administrative data. These include a patient's preference for life-sustaining treatments, functional status, and other factors.

Hospital Comments, 3Q2005

We support the Patient, Provider, and Payer and "empowered", educated" decision-making. Quality improvement is not new; it is an on-going commitment.

=====

PROVIDER: Huguley Memorial Medical Center

THCIC ID: 047000

QUARTER: 3

YEAR: 2005

Certified with comments

The following comments reflect concerns, errors, or limitations of discharge data for THCIC mandatory reporting requirements as of June 1, 2006. Under the requirements we are unable to alter our comments after June 1, 2006.

If any errors are discovered in our data after this point we will be unable to communicate these due to THCIC. This data is administrative data, which hospitals collect for billing purposes, and not clinical data, from which you can make judgments about patient care.

Submission Timing

The State requires us to submit a snapshot of billed claims, extracted from our database approximately 20 days following the close of the calendar year quarter. Any discharged patient encounters not billed by this cut-off date will not be included in the quarterly submission file sent in.

Diagnosis and Procedures

The data submitted matches the state's reporting requirements but may be incomplete due to a limitation on the number of diagnoses and procedures the state allows us to include for each patient. In other words, the state's data file may not fully represent all diagnoses treated by the hospital or all procedures performed, which can alter the true picture of a patient's hospitalization, sometimes significantly.

Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD-9-CM. This is mandated by the federal government and all hospitals must comply.

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code as many as 25 diagnoses and 25 procedures for each patient record. One limitation of using the ICD-9-CM is that there does not exist a code for every possible diagnosis and procedure due to the continued evolution of medicine; new codes are added yearly as coding manuals are updated.

The state is requiring us to submit ICD-9-CM data on each patient but has limited the number of diagnoses and procedures to the first nine diagnoses codes and the first six procedure codes. As a result, the data sent by us do meet state requirements but cannot reflect all the codes an individual patient's record may have been assigned. This means also that true total volumes may not be represented by the state's data file, which therefore make percentage calculations inaccurate (i.e. Mortality percentages for any given diagnosis or procedure, percentage of patients in each severity of illness category). It would be obvious; therefore, those sicker patients (more diagnosis and procedures) are less accurately reflected by the 1450 format. It then stands to reason that hospitals, which treat sicker patients, are likewise less accurately reflected.

There is no mechanism provided in the reporting process to factor in DNR (Do Not Resuscitate) patients. Any mortalities occurring to a DNR patient are not recognized separately; therefore mortality ratios may be accurate for reporting standards but overstated.

Data Integrity

Hospital Comments, 3Q2005

In an effort to continuously improve patient safety, communications, and information-sharing, Huguley implemented a computer conversion to an electronic medical record system in January 2004. This conversion impacts the financial billing system which is used to report THCIC data. Various mapping issues have been corrected since the implementation.

One encounter with DRG 107 the care was transferred to another provider during care. Attending practitioner did not reflect change. Another encounter with DRG 320 was mapped to an incorrect physician. One encounter admitted from the ER was not updated with the Admitting physician.

All physician license numbers and names have been validated with the physician and the website recommended by the state. One physician's name was incorrectly entered on his state license. This physician had two encounters for the specified reporting period.

This is due to internal processing for determination of the source of payment.
4% of total discharges were charity for 3rd Quarter 2005.

=====

PROVIDER: St Lukes Episcopal Hospital
THCIC ID: 118000
QUARTER: 3
YEAR: 2005

Certified with comments

The data reports for Quarter 3, 2005 do not accurately reflect patient volume or severity.

Patient Volume

Data reflects administrative claims data (Uniform Billing data elements) that are a snapshot of claims one month following quarter-end. If the encounter has not yet been billed, data will not be reflected in this quarter.

Severity

Descriptors for newborn admissions are based on national billing data elements (UB92) and definitions of each element can and do vary from hospital to hospital. Because of the absence of universal definitions for normal delivery, premature delivery and sick baby, this category cannot be used for comparison across hospitals. The DRG is the only somewhat meaningful description of the infant population born at a facility.

More importantly, not all clinically significant conditions, such as the heart's ejection fraction, can be captured and reflected in the various billing data elements including the ICD-9-CM diagnosis coding system.

As a result, the true clinical picture of the patient population cannot be adequately demonstrated using admissions and billing data.

Claim Filing Indicator

Hospital Comments, 3Q2005

Due to a format change made by THCIC after the submission of the data, the Claim Filing Indicator Codes (Payer designations) reflect the old format and not the new one.

=====

PROVIDER: The Methodist Hospital
THCIC ID: 124000
QUARTER: 3
YEAR: 2005

Certified with comments

The Methodist Hospital data for Q3 2005 has been certified. 85 accounts are missing due to late billing, accounts billed prior to data submission, missing charges, invalid physicians and combined accounts. Physician data is correct in this data set.

=====

PROVIDER: Navarro Regional Hospital
THCIC ID: 141000
QUARTER: 3
YEAR: 2005

Certified with comments

Navarro Regional Hospital is an acute general medical-surgical hospital with the additional services of a Skilled Nursing Facility and an Acute Rehabilitation Unit. The data in the public release file may or may not adequately allow separation of patients in the acute hospital from those in the other two units. Admixture of all three units can lead to increases for acute hospitals alone. It is notable that for the 3rd quarter, 2005, in at least 24 of the 26 deaths, the patients or family members had requested that full efforts to maintain life not be pursued (Advanced Directive, Living Will or Do Not Resuscitate Orders).

DATA CONTENT

This data is administrative data, which hospitals collect for billing purposes, and not clinical data, from which you can make judgements about patient care. The data submitted are certified to be accurate representations of the billing data recorded, to the best of our knowledge. The data is not certified to represent the complete set of data available on all inpatients but rather that data which was reported to a particular payer as required by that payer.

PHYSICIAN REVIEW OF THE DATA

Physicians admitting inpatients to Charlton, from time to time, review physician specific data that is generated from our internal computer systems. Medical Center did not attempt to have every physician individually review each patient in the actual data set returned to us by the State. We matched the State generated reports to internally generated reports to ensure data submission accuracy. We then reviewed these reports with Physician Leadership who assisted us in

generating the comments contained herein.

SUBMISSION TIMING

The State requires us to submit a snapshot of billed claims, extracted from our database

approximately 20 days following the close of the calendar year quarter. Any

discharged patient

encounters not billed by this cut-off date will not be included in the quarterly submission. Claims

billed in the subsequent quarter for discharges of a previous quarter will be submitted to the State

in the subsequent quarter's submission.

It should also be noted that the payer might deny all or part of a bill for which an adjustment

might be made on our internal data systems. The process of appealing a denied claim or service

and coming to final resolution can take as long as a year to resolve with a payer.

Obviously any

outcome of these processes would not be reflected in a quarter's data.

OMISSION OF OBSERVATION PATIENTS

The reported data only include inpatient status cases. For various conditions, such as chest pain,

there are observation patients that are treated effectively in a short non-inpatient stay and are

never admitted into an inpatient status. The ratio for Charlton Methodist Hospital is about 1

observation patient for every 10 inpatients. Thus, calculations of inpatient volumes and length of

stay may not include all patients treated in our hospital.

DIAGNOSIS AND PROCEDURES

The state and billing regulations require us to submit diagnoses and procedures in ICD-9-CM

standard codes. The hospital can code up to 25 diagnosis codes and 25 procedure codes. The

state data submission requirements limit us to the first nine diagnosis codes and the first six

procedure codes. As a result, the data sent by us do meet state requirements but may not reflect

all the codes an individual patient's record may have been assigned. Approximately 13% of

Charlton Methodist Hospital's patient population have more than nine diagnoses and/or six

procedures assigned.

Therefore, those patients with multiple diseases and conditions (more diagnoses and procedures)

are less accurately reflected by the 1450 format. It then stands to reason that hospitals, which

treat sicker patients, are likewise less accurately reflected. Further, true total volumes for a

diagnosis or procedure may not be represented by the State's data file, which therefore make

percentage calculations such as mortality rates or severity of illness adjustments inaccurate.

Charlton Methodist Hospital adheres to national coding standards but it should be noted that

coding cannot establish cause and effect (i.e. Infection coded, but does not identify whether

present upon admission or developed in-house; fall coded, but does not identify

whether the fall occurred prior to or during hospitalizations.). It is also difficult to distinguish between a co-morbidity and a complication.

NORMAL NEWBORNS

Admission Source or Admission Type codes are not the best way to reflect the pre-maturity or illness of an infant. Per State data submission regulation, if Admission Type is coded as a "newborn" then Admit Source is a code used to delineate the type of birth as "normal newborn" "premature delivery" "sick baby" and "extra-mural birth." Admission type is a code used to classify a baby as a newborn only if the baby was actually born in the reporting hospital. A very sick baby, transferred from another hospital or facility will be coded as an Admission Type of "Emergency" and Admission Source of "Xfer from Hospital." The actual conditions and experiences of an infant in our facility are captured elsewhere in the data file, namely, in the ICD-9-CM diagnoses and procedures codes.

RACE AND ETHNICITY CODES

We are concerned about the accuracy of the State mandated race and ethnicity codes. Some patients decline to answer our inquiries about their race or ethnic classification. We certify that the race and ethnicity codes we submit represent nothing more than the patient's own classification or our best judgment.

STANDARD/NON-STANDARD SOURCE OF PAYMENT

The standard and non-standard source of payment codes are an example of data required by the State that is not contained within the standard UB92 billing record. In order to meet this requirement each payer's identification must be categorized into the appropriate standard and non-standard source of payment value. It is important to note that sometimes, many months after billing and THCIC data submission, a provider may be informed of a retroactive change in a patient's eligibility for a particular payer. This will cause the Source of Payment data to be inaccurate as reported in the quarter's snapshot of the data. The categories most effected are "Self Pay" and "Charity" shifting to "Medicaid" eligible.

REVENUE CODE AND CHARGE DATA

The charge data submitted by revenue code represents Methodist's charge structure, which may or may not be the same for a particular procedure or supply as another provider.

CAUTION ON THE USE OF DATA WITH SMALL NUMBERS OF CASES IN PERCENTAGE COMPARISONS

Besides the data limitations mentioned above, the number of cases that aggregate into a particular diagnosis, procedure or Diagnosis Related Grouping could render percentage calculations statistically non-significant if the number of cases is too small.

SEVERITY ADJUSTMENT SCORES

THCIC is responsible for providing and maintaining a tool to assign an All-patient

Hospital Comments, 3Q2005

Refined

(APR) Diagnosis Related Group (DRG) severity score for each encounter at their data processing center. Charlton Methodist Hospital neither creates nor submits the APR DRG contained in the data sets.

PHYSICIAN UPIN NUMBER ERRORS

All physician UPIN numbers and names have been validated with the physician and the UPIN web-site as accurate even though some remain unidentified in the THCIC data tables. This appears to be due to delays in updating the THCIC UPIN data tables.

TIRR (The Institute for Rehabilitation and Research) was founded in 1959 in Houston's Texas Medical Center by William A. Spencer, M.D. Dr. Spencer articulated a rehabilitation philosophy of maximizing independence and quality of life that continues to guide the development of our programs. This guiding philosophy includes providing appropriate medical intervention, helping the patient establish realistic goals and objectives, and supporting the patient to maintain personal integrity and family and social ties. TIRR is an internationally known, fully accredited teaching hospital that specializes in medical care, education and research in the field of catastrophic rehabilitation. It has been recognized every year in a nationwide survey of physicians by U.S. News & World Report as one of the best hospitals in America.

The hospital's research into developing improved treatment procedures has substantially reduced secondary complications of catastrophic injuries as well as average lengths of stay.

TIRR's inpatient programs are outcome-oriented with standardized functional scales by which to measure a patient's progress. These programs include:

Spinal Cord Injury. TIRR is one of only 16 hospitals in the country that has Model System designation by NIDRR for its Spinal Cord Injury Program. The hospital is recognized nationally for exemplary patient care, education and research, and especially for management of wounds and ventilator-dependent patients.

Brain Injury and Stroke. The Brain Injury and Stroke Program provides a continuum of interdisciplinary management of the physical, communicative, cognitive, and behavioral problems faced by people with brain injuries. Such injuries may be the result of trauma, stroke, anoxia, tumor, infection, or metabolic disorders.

Specialty Rehabilitation. This program serves patients with neurological and neuromuscular disorders and multiple trauma, including multiple sclerosis, Parkinson's disease, post-polio, etc.

Amputee. The Amputee Program serves patients with traumatic amputations, congenital limb deficiencies, and disease related amputations. TIRR is uniquely experienced in complex multiple limb loss associated with trauma and electrical burns and with amputations associated with diabetes mellitus and peripheral vascular disease.

Pediatric and Adolescent Rehabilitation. TIRR treats children and adolescents with brain or spinal cord injuries, as well other types of disabling disorders and injuries.

Data Content

This data is administrative data, which hospitals collect for billing purposes. Administrative data may not accurately represent the clinical details of an encounter.

The state requires us to submit inpatient claims, by quarter year, gathered from a form called an UB92, in a standard government format called HCFA 837 EDI electronic claim format. Then the state specifications require additional data elements to be included over and above that. Adding those additional data places programming burdens on the hospital since it is 'over and above' the actual hospital billing process. Errors can occur due to this additional programming, but the public should not conclude that billing data sent to our payers is inaccurate. These errors have been corrected to the best of our knowledge.

If a medical record is unavailable for coding the encounter is not billed and is not included in the data submission. This represents a rare event that is less than 1% of the encounter volume.

Diagnosis and Procedures

Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD 9 CM. This is mandated by the federal government.

The hospital complies with the guidelines for assigning these diagnosis codes, however, this is often driven by physician's subjective criteria for defining a diagnosis. For example, while one physician may diagnose a patient with anemia when the patient's blood hemoglobin level falls below 9.5, another physician may not diagnose the patient with anemia until their blood hemoglobin level is below 9.0. In both situations, a diagnosis of anemia is correctly assigned, but the criteria used by the physician to determine that diagnosis was different. An 'apples to apples' comparison cannot be made, which makes it difficult to obtain an accurate comparison of hospital or physician performance.

The codes also do not distinguish between conditions present at the time of the patient's admission to the hospital and those occurring during hospitalization. For example, if a code indicating an infection is made, it is not always possible to determine if the patient had an infection prior to admission, or developed an infection during their hospitalization.

This makes it difficult to obtain accurate information regarding things such as complication rates.

The data submitted matches the state's reporting requirements but may be incomplete due to a limitation on the number of diagnoses and procedures the state allows us to include for each patient. In other words, the state's data file may not fully represent all diagnoses treated by the hospital or all procedures performed, which can alter the true picture of a patient's hospitalization, sometimes significantly.

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code up to 99 diagnoses and 99 procedures for each patient record. The state is requiring us to submit ICD-9-CM data on each patient but has limited

Hospital Comments, 3Q2005

the number of diagnoses and procedures to the first 25 diagnoses codes and the first 25 procedure codes. As a result, the data sent by us does meet state requirements but cannot reflect all the codes an individual patient's record may have been assigned. This means also that true total volumes may not be represented by the state's data file, which therefore make percentage calculations inaccurate (i.e. mortality percentages for any given diagnosis or procedure, percentage of patients in each severity of illness category). It would be obvious; therefore, those sicker patients (more diagnoses and procedures) are less accurately reflected by the 837 format. It then stands to reason that hospitals, which treat sicker patients, are likewise less accurately reflected.

Length of Stay

The length of stay data element contained in the state's certification file is only three characters long. Thus any patients discharged with a length of stay greater than 999 days will not be accurately stored within the certification database. It is rare that patients stay longer than 999 days, therefore, it is not anticipated that this limitation will affect this data.

Admit Source data for Normal Newborn

When the Admit type is equal to 'newborn', the admit source should indicate whether the baby was a normal newborn, premature delivery, sick baby, extramural birth, or information not available. The best way to focus on severity of illness regarding an infant would be to check the infant's diagnosis at discharge, not the admitting source code. Many hospital information systems and registration process defaults to 'normal delivery' as the admission source. Therefore, admission source does not always give an accurate picture.

If admission source is used to examine length of stay or mortality for normal neonates using the admit source to identify the cases, the data will reflect premature and sick babies mixed in with the normal newborn data. Harris Methodist HEB recommends use of ICD9 coding data to identify neonates. This methodology will ensure correct identification of the clinical status of the newborn admission.

Race/Ethnicity

As of the December 7, 2001, the THCIC Board indicated that they would be creating guidelines for use by hospitals. These guidelines will provide better clarity for the accurate collection of this data. Hospitals do not routinely collect race and ethnicity as part of the admission process, that this has been added to meet the THCIC requirement. Our admissions staff indicates that many patients are very sensitive about providing race and ethnicity information. Therefore, depending on the circumstances of the patient's admission, race and ethnicity data may be subjectively collected. Therefore, the race and ethnicity data may not provide an accurate representation of the patient population for a facility.

Standard/Non-Standard Source of Payment

The standard and non-standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement, each payer identifier must be categorized into the appropriate standard and non-standard source of payment value. These values might not accurately reflect the hospital payer information, because those payers identified contractually as both 'HMO, and PPO' are categorized as 'Commercial PPO'. Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Cost/ Revenue Codes

The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual

Hospital Comments, 3Q2005

payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to managed care-negotiated discounts and denial of payment by insurance companies. Charges also do not reflect the actual cost to deliver the care that each patient needs.

Discharge Disposition

THR has identified a problem with a vendor (Seimens) extract that diverts some patient discharges to "home" as opposed to rehab. THR will communicate this issue and the plan to address this issue in writing to the THCIC Executive Director.

Data Source. The source of this data, the electronic 1450, is administrative in nature, and was collected for billing purposes. It is not clinical data and should be cautiously used to evaluate health care quality.

* The Hospital can only list 4 physicians that were involved with any one patient. Other physicians who were involved in those cases will not be identified.

Payer Codes. The payer codes utilized in the THCIC data base were defined by the state. They are not utilizing the standard payer information from the claim.

Revenue Codes and Charges. Charges associated with the 1450 data do not represent actual payments or costs for services.

Severity Adjustment. THCIC is using the 3M APR-DRG system to assign the All-Patient Refined (APR) DRG, severity and risk of mortality scores.

The scores represent a categorization of patient severity and mortality risk. The assignment is made by evaluation of the patient's age, sex, diagnosis codes, procedure codes, and discharge status.

* The program can only use the codes available in the 1450 data file, e.g., nine diagnosis and six procedure codes. If all the patient's diagnosis codes were available the assignment may be different than when limited to those available in the 1450 data.

Timing of Data Collection. Hospitals must submit data to THCIC no later than 60 days after the close of the quarter.

* Not all claims may have been billed at this time.

* Internal data may be updated later and appear different than the data on the claim. Unless the payment is impacted, the hospitals does not rebill when a data field is changed internally. This results in differences between internal systems and the snapshot of data that was taken at the end of the quarter.

THCIC DATA RELEASE COMMENTS FOR 2005

Since 1975 Medical Center of Plano has maintained a reputation for superior health care as the largest and most sophisticated medical facility in Collin County. The Medical Center is a 423 bed, JCAHO Accredited Hospital which offers a broad base of quality patient services.

Hospital Comments, 3Q2005

Medical Center of Plano's mission is to be a health care organization founded on the values of excellence, leadership, integrity and compassion. We exist to provide the highest quality services for the individuals and families we serve.

General Comments:

" Medical Center of Plano supports the effort of the THCIC to provide publicly released hospital data.

" Medical Center of Plano is committed to continuous Performance Improvement efforts.

" The public data file does not contain all the diagnosis and procedure codes. It contains only 9 diagnosis codes and 6 procedure codes. This may affect the volume of procedures, the severity adjustment and the mortality rate.

Data Comments:

" Inpatient discharge data has been collected from information that is used for billing purposes and, is not clinical data. Due to the differences in health care organizations and data collecting practices throughout Texas, there can be limitations with comparing outcomes.

" THCIC has excluded data when five or fewer patients had a procedure and did not perform statistical analysis when there were fewer than 30 patients.

" Although the risk-adjusting software helps in making the data more comparable among facilities, it too is an approximation that may not truly represent the mix of patients. This is particularly true for mortalities in patients admitted for end of life care.

" Medical Center of Plano provides quality care to our women/children patient population. Our 23 bed Labor and Delivery suite, 10 bed antepartum unit, 41 bed level II Neonatal Intensive Care Unit and 40 bassinets nursery; is staffed with highly competent nursing personnel. The decision to perform a cesarean section is most often a decision between the patient and her physician. We believe that the right C-section rate is determined by a healthy baby and healthy mom.

=====

PROVIDER: Oakbend Medical Center
THCIC ID: 230000
QUARTER: 3
YEAR: 2005

Certified with comments

OakBend Medical Center is an acute, general medical-surgical hospital with the additional services of a Skilled Nursing Facility. The way the PDUF mortality information is presented does not accurately reflect our case mix of patients or numbers of cases per physician. Several physicians have 70-80% nursing home patients with higher numbers of co-morbidities.

Since the state limits the number of diagnoses and procedures, the data cannot reflect all codes an individual patient's records may have been assigned. This also means that true total volumes may not be represented by the state's data file therefore making percentage calculations skewed. Also not reflected accurately is the number of patients cared for by consulting physicians. Many consultants seldom admit patients to the inpatient setting, but consult on hundreds. This causes inaccurate mortality rates.

Hospital Comments, 3Q2005

Since this data is taken from administrative data, it cannot accurately represent the patient's clinical picture. OakBend Medical Center urges caution in using this information to evaluate quality of care. We encourage patients to talk with the primary care physician or the hospital about this data. Our commitment to quality is strong and continuous.

Data Content

This data is administrative data, which hospitals collect for billing purposes. Administrative data may not accurately represent the clinical details of an encounter.

The state requires us to submit inpatient claims, by quarter year, gathered from a form called an UB92, in a standard government format called HCFA 837 EDI electronic claim format. Then the state specifications require additional data elements to be included over and above that. Adding those additional data places programming burdens on the hospital since it is 'over and above' the actual hospital billing process. Errors can occur due to this additional programming, but the public should not conclude that billing data sent to our payers is inaccurate. These errors have been corrected to the best of our knowledge.

If a medical record is unavailable for coding the encounter is not billed and is not included in the data submission. This represents a rare event that is less than 1% of the encounter volume.

Diagnosis and Procedures

Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD 9 CM. This is mandated by the federal government.

The hospital complies with the guidelines for assigning these diagnosis codes, however, this is often driven by physician's subjective criteria for defining a diagnosis. For example, while one physician may diagnose a patient with anemia when the patient's blood hemoglobin level falls below 9.5, another physician may not diagnose the patient with anemia until their blood hemoglobin level is below 9.0. In both situations, a diagnosis of anemia is correctly assigned, but the criteria used by the physician to determine that diagnosis was different. An 'apples to apples' comparison cannot be made, which makes it difficult to obtain an accurate comparison of hospital or physician performance.

The codes also do not distinguish between conditions present at the time of the patient's admission to the hospital and those occurring during hospitalization. For example, if a code indicating an infection is made, it is not always possible to determine if the patient had an infection prior to admission, or developed an infection during their hospitalization. This makes it difficult to obtain accurate information regarding things such as complication rates.

The data submitted matches the state's reporting requirements but may be incomplete due to a limitation on the number of diagnoses and procedures the state allows us to include for each patient. In other words, the state's data file may not fully represent all diagnoses treated by the hospital or all procedures performed, which can alter the true picture of a patient's hospitalization, sometimes significantly.

Hospital Comments, 3Q2005

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code up to 99 diagnoses and 99 procedures for each patient record. The state is requiring us to submit ICD-9-CM data on each patient but has limited the number of diagnoses and procedures to the first 25 diagnoses codes and the first 25 procedure codes. As a result, the data sent by us does meet state requirements but cannot reflect all the codes an individual patient's record may have been assigned. This means also that true total volumes may not be represented by the state's data file, which therefore make percentage calculations inaccurate (i.e. mortality percentages for any given diagnosis or procedure, percentage of patients in each severity of illness category). It would be obvious; therefore, those sicker patients (more diagnoses and procedures) are less accurately reflected by the 837 format. It then stands to reason that hospitals, which treat sicker patients, are likewise less accurately reflected.

Length of Stay

The length of stay data element contained in the state's certification file is only three characters long. Thus any patients discharged with a length of stay greater than 999 days will not be accurately stored within the certification database. It is rare that patients stay longer than 999 days, therefore, it is not anticipated that this limitation will affect this data.

Admit Source data for Normal Newborn

When the Admit type is equal to 'newborn', the admit source should indicate whether the baby was a normal newborn, premature delivery, sick baby, extramural birth, or information not available. The best way to focus on severity of illness regarding an infant would be to check the infant's diagnosis at discharge, not the admitting source code. Many hospital information systems and registration process defaults to 'normal delivery' as the admission source. Therefore, admission source does not always give an accurate picture.

If admission source is used to examine length of stay or mortality for normal neonates using the admit source to identify the cases, the data will reflect premature and sick babies mixed in with the normal newborn data. Harris Methodist Fort Worth recommends use of ICD9 coding data to identify neonates. This methodology will ensure correct identification of the clinical status of the newborn admission.

Race/Ethnicity

As of the December 7, 2001, the THCIC Board indicated that they would be creating guidelines for use by hospitals. These guidelines will provide better clarity for the accurate collection of this data. Hospitals do not routinely collect race and ethnicity as part of the admission process, that this has been added to meet the THCIC requirement. Our admissions staff indicates that many patients are very sensitive about providing race and ethnicity information. Therefore, depending on the circumstances of the patient's admission, race and ethnicity data may be subjectively collected. Therefore, the race and ethnicity data may not provide an accurate representation of the patient population for a facility.

Standard/Non-Standard Source of Payment

The standard and non-standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement, each payer identifier must be categorized into the appropriate standard and non-standard source of payment value. These values might not accurately reflect the hospital payer information, because those payers identified contractually as both 'HMO, and PPO' are categorized as 'Commercial PPO'. Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Hospital Comments, 3Q2005

Cost/ Revenue Codes

The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to managed care-negotiated discounts and denial of payment by insurance companies. Charges also do not reflect the actual cost to deliver the care that each patient needs.

Discharge Disposition

THR has identified a problem with a vendor (Seimens) extract that diverts some patient discharges to "home" as opposed to rehab. THR will communicate this issue and the plan to address this issue in writing to the THCIC Executive Director.

THCIC ID: 255000
QUARTER: 3
YEAR: 2005

Certified with comments

DATA CONTENT

This data is administrative data, which hospitals collect for billing purposes, and not clinical data, from which you can make judgements about patient care. The data submitted are certified to be accurate representations of the billing data recorded, to the best of our knowledge. The data is not certified to represent the complete set of data available on all inpatients but rather that data which was reported to a particular payer as required by that payer.

PHYSICIAN REVIEW OF THE DATA

Physicians admitting inpatients to Methodist, from time to time, review physician specific data that is generated from our internal computer systems. Medical Center did not attempt to have every physician individually review each patient in the actual data set returned to us by the State. We matched the State generated reports to internally generated reports to ensure data submission accuracy. We then reviewed these reports with Physician Leadership who assisted us in generating the comments contained herein.

SUBMISSION TIMING

The State requires us to submit a snapshot of billed claims, extracted from our database approximately 20 days following the close of the calendar year quarter. Any discharged patient encounters not billed by this cut-off date will not be included in the quarterly submission. Claims billed in the subsequent quarter for discharges of a previous quarter will be submitted to the State in the subsequent quarter's submission.

It should also be noted that the payer might deny all or part of a bill for which an adjustment might be made on our internal data systems. The process of appealing a denied claim or service and coming to final resolution can take as long as a year to resolve with a payer.

Obviously any outcome of these processes would not be reflected in a quarter's data.

OMISSION OF OBSERVATION PATIENTS

The reported data only include inpatient status cases. For various conditions, such as chest pain, there are observation patients that are treated effectively in a short non-inpatient stay and are never admitted into an inpatient status. The ratio for Methodist Medical Center is about 1.73 observation patients for every 10 inpatients. Thus, calculations of inpatient volumes and length of stay may not include all patients treated in our hospital.

DIAGNOSIS AND PROCEDURES

The state and billing regulations require us to submit diagnoses and procedures in ICD-9-CM standard codes. The hospital can code up to 25 diagnosis codes and 25 procedure codes. The state data submission requirements limit us to the first nine diagnosis codes and the first six procedure codes. As a result, the data sent by us do meet state requirements but may not reflect all the codes an individual patient's record may have been assigned. Approximately 20% of Methodist Medical Center's patient population have more than nine diagnoses and/or six procedures assigned.

Therefore, those patients with multiple diseases and conditions (more diagnoses and procedures) are less accurately reflected by the 1450 format. It then stands to reason that hospitals, which treat sicker patients, are likewise less accurately reflected. Further, true total volumes for a diagnosis or procedure may not be represented by the State's data file, which therefore make percentage calculations such as mortality rates or severity of illness adjustments inaccurate.

Methodist Medical Center adheres to national coding standards but it should be noted that coding cannot establish cause and effect (i.e. Infection coded, but does not identify whether present upon admission or developed in-house; fall coded, but does not identify whether the fall occurred prior to or during hospitalizations.). It is also difficult to distinguish between a co-morbidity and a complication.

NORMAL NEWBORNS

Admission Source or Admission Type codes are not the best way to reflect the pre-maturity or illness of an infant. Per State data submission regulation, if Admission Type is coded as a "newborn" then Admit Source is a code used to delineate the type of birth as "normal newborn" "premature delivery" "sick baby" and "extra-mural birth." Admission type is a code used to classify a baby as a newborn only if the baby was actually born in the reporting hospital. A very sick baby, transferred from another hospital or facility will be coded as an Admission Type of

Hospital Comments, 3Q2005

"Emergency" and Admission Source of "Xfer from Hospital." Methodist Medical Center operates a level 3 critical care nursery, which receives transfers from other facilities. The actual conditions and experiences of an infant in our facility are captured elsewhere in the data file, namely, in the ICD-9-CM diagnoses and procedures codes.

RACE AND ETHNICITY CODES

We are concerned about the accuracy of the State mandated race and ethnicity codes. Some patients decline to answer our inquiries about their race or ethnic classification. We certify that the race and ethnicity codes we submit represent nothing more than the patient's own classification or our best judgment.

STANDARD/NON-STANDARD SOURCE OF PAYMENT

The standard and non-standard source of payment codes are an example of data required by the State that is not contained within the standard UB92 billing record. In order to meet this requirement each payer's identification must be categorized into the appropriate standard and non-standard source of payment value. It is important to note that sometimes, many months after billing and THCIC data submission, a provider may be informed of a retroactive change in a patient's eligibility for a particular payer. This will cause the Source of Payment data to be inaccurate as reported in the quarter's snapshot of the data. The categories most effected are "Self Pay" and "Charity" shifting to "Medicaid" eligible.

REVENUE CODE AND CHARGE DATA

The charge data submitted by revenue code represents Methodist's charge structure, which may or may not be the same for a particular procedure or supply as another provider.

CAUTION ON THE USE OF DATA WITH SMALL NUMBERS OF CASES IN PERCENTAGE COMPARISONS

Besides the data limitations mentioned above, the number of cases that aggregate into a particular diagnosis, procedure or Diagnosis Related Grouping could render percentage calculations statistically non-significant if the number of cases is too small.

SEVERITY ADJUSTMENT SCORES

THCIC is responsible for providing and maintaining a tool to assign an All-patient Refined (APR) Diagnosis Related Group (DRG) severity score for each encounter at their data processing center. Methodist Medical Center neither creates nor submits the APR DRG contained in the data sets.

PHYSICIAN UPIN NUMBER ERRORS

All physician UPIN numbers and names have been validated with the physician and the UPIN web-site as accurate even though some remain unidentified in the THCIC data tables. This appears to be due to delays in updating the THCIC UPIN data tables.

PROVIDER: Harris Methodist-Erath County
THCIC ID: 256000

QUARTER: 3
YEAR: 2005

Certified with comments

Data Content

This data is administrative data, which hospitals collect for billing purposes. Administrative data may not accurately represent the clinical details of an encounter.

The state requires us to submit inpatient claims, by quarter year, gathered from a form called an UB92, in a standard government format called HCFA 837 EDI electronic claim format. Then the state specifications require additional data elements to be included over and above that. Adding those additional data places programming burdens on the hospital since it is 'over and above' the actual hospital billing process. Errors can occur due to this additional programming, but the public should not conclude that billing data sent to our payers is inaccurate. These errors have been corrected to the best of our knowledge.

If a medical record is unavailable for coding the encounter is not billed and is not included in the data submission. This represents a rare event that is less than 1% of the encounter volume.

Diagnosis and Procedures

Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD 9 CM. This is mandated by the federal government.

The hospital complies with the guidelines for assigning these diagnosis codes, however, this is often driven by physician's subjective criteria for defining a diagnosis. For example, while one physician may diagnose a patient with anemia when the patient's blood hemoglobin level falls below 9.5, another physician may not diagnose the patient with anemia until their blood hemoglobin level is below 9.0. In both situations, a diagnosis of anemia is correctly assigned, but the criteria used by the physician to determine that diagnosis was different. An 'apples to apples' comparison cannot be made, which makes it difficult to obtain an accurate comparison of hospital or physician performance.

The codes also do not distinguish between conditions present at the time of the patient's admission to the hospital and those occurring during hospitalization. For example, if a code indicating an infection is made, it is not always possible to determine if the patient had an infection prior to admission, or developed an infection during their hospitalization.

This makes it difficult to obtain accurate information regarding things such as complication rates.

The data submitted matches the state's reporting requirements but may be incomplete due to a limitation on the number of diagnoses and procedures the state allows us to include for each patient. In other words, the state's data file may not fully represent all diagnoses treated by the hospital or all procedures performed, which can alter the true picture of a patient's hospitalization, sometimes significantly.

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code up to 99 diagnoses and 99 procedures for each patient record. The state is requiring us to submit ICD-9-CM data on each patient but has limited the number of diagnoses and procedures to the first 25 diagnoses codes and the first 25 procedure codes. As a result, the data sent by us does meet state requirements but cannot reflect all the codes an individual patient's record may have been assigned. This means also that true total

Hospital Comments, 3Q2005

volumes may not be represented by the state's data file, which therefore make percentage calculations inaccurate (i.e. mortality percentages for any given diagnosis or procedure, percentage of patients in each severity of illness category). It would be obvious; therefore, those sicker patients (more diagnoses and procedures) are less accurately reflected by the 837 format. It then stands to reason that hospitals, which treat sicker patients, are likewise less accurately reflected.

Length of Stay

The length of stay data element contained in the state's certification file is only three characters long. Thus any patients discharged with a length of stay greater than 999 days will not be accurately stored within the certification database. It is rare that patients stay longer than 999 days, therefore, it is not anticipated that this limitation will affect this data.

Admit Source data for Normal Newborn

When the Admit type is equal to 'newborn', the admit source should indicate whether the baby was a normal newborn, premature delivery, sick baby, extramural birth, or information not available. The best way to focus on severity of illness regarding an infant would be to check the infant's diagnosis at discharge, not the admitting source code. Many hospital information systems and registration process defaults to 'normal delivery' as the admission source. Therefore, admission source does not always give an accurate picture.

If admission source is used to examine length of stay or mortality for normal neonates using the admit source to identify the cases, the data will reflect premature and sick babies mixed in with the normal newborn data. Harris Methodist Erath County recommends use of ICD9 coding data to identify neonates. This methodology will ensure correct identification of the clinical status of the newborn admission.

Race/Ethnicity

As of the December 7, 2001, the THCIC Board indicated that they would be creating guidelines for use by hospitals. These guidelines will provide better clarity for the accurate collection of this data. Hospitals do not routinely collect race and ethnicity as part of the admission process, that this has been added to meet the THCIC requirement. Our admissions staff indicates that many patients are very sensitive about providing race and ethnicity information. Therefore, depending on the circumstances of the patient's admission, race and ethnicity data may be subjectively collected. Therefore, the race and ethnicity data may not provide an accurate representation of the patient population for a facility.

Standard/Non-Standard Source of Payment

The standard and non-standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement, each payer identifier must be categorized into the appropriate standard and non-standard source of payment value. These values might not accurately reflect the hospital payer information, because those payers identified contractually as both 'HMO, and PPO' are categorized as 'Commercial PPO'. Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Cost/ Revenue Codes

The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to managed care-negotiated discounts and denial of payment by insurance companies. Charges also do not reflect the actual cost to deliver the care that each

patient needs.

PROVIDER: R E Thomason General Hospital
THCIC ID: 263000
QUARTER: 3
YEAR: 2005

Certified with comments

In this database only one primary physician is allowed. This represents the physician at discharge in this institution. At an academic medical center such as Thomason, patients are cared for by teams of physicians that rotate at varying intervals. Therefore, many patients, particularly long term patients, may actually be managed by several different teams. The practice of attributing patient outcomes in the database to a single physician may result in inaccurate information.

Mapping for the payor source indicates differences. In the THCIC information, Charity and self pay appear to be included in the commercial line and the commercial insurances are itemized separately. On the THCIC report the payor source fields have increased to include CHIP, other not federal programs and HMOs.

Thru our Performance Improvement process, we review the data and strive to make changes to result in improvement. Overall, the data mapping and comparison of like data has shown steady improvement from previous quarters.

PROVIDER: Baylor Medical Center-Waxahachie
THCIC ID: 285000
QUARTER: 3
YEAR: 2005

Certified with comments

Submission Timing

Hospital Comments, 3Q2005

Baylor estimates that our data volumes for the calendar year time period submitted may include 96% to 100% of all cases for that time period. The state requires us to submit a snapshot of billed claims, extracted from our database approximately 20 days following the close of the calendar year quarter. Any discharged patient encounters not billed by this cut-off date will not be included in the quarterly submission file sent in.

Physician Identification

All physician license numbers and names have been validated as accurate against a physician reference file that is derived from information provided by the Texas Board of Medical Examiners. Those physicians not yet assigned a state license number at the time of data submission are given temporary numbers by the hospital for state reporting purposes. Due to the "lag" time between when the physician is licensed and when THCIC receives the information, some physicians may remain unidentified in the THCIC Practitioner Reference Files.

The THCIC minimum data set houses only two (2) physician fields; Attending Physician and Operating or Other Physician (if applicable) as reflected on the UB92 billing document. Mortality rates, case costs and other data calculated for this population of physicians may be misrepresentative. Due to the complexity of most inpatient admissions many physicians provide care to patients throughout an admission. Consulting physicians may prescribe and treat patients on behalf of the physician listed as the attending physician. Analysis of this physician information should carefully consider that significant variations in case count, case cost, and mortality may not be directly related to the care provided by the attending physician, but also reflect the varied use of consultants.

While hospitals document many treating physicians (surgeons and consultants) for each case, THCIC maintains only one (1) additional physician per case besides the Attending. "Other" physician case volumes, mortality, case costs and LOS, will frequently be inaccurate because of this limitation. Surgeons and consulting physicians beyond one that may have been involved on a case will not be credited with providing care for that patient. Analysis of "other physician" information should, therefore, take into consideration that a significant portion of treating physicians are excluded from the patient cases.

Diagnosis and Procedures

Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD-9-CM. This is mandated by the federal government and all hospitals must comply.

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code as many as 25 diagnoses and 25 procedures for each patient record. One limitation of using the ICD-9-CM system is that there does not exist a code for every possible diagnosis and procedure due to the continued evolution of medicine; new codes are added yearly as coding manuals are updated.

Race/Ethnicity

There are no national standards regarding patient race categorization so hospitals may not have the same designations from which patients can choose. The state has recently attempted to standardize a valid set of race codes for this project but these are not universally used by all hospitals. Each hospital must independently map their specific codes to the state's race code categories. This mapping may not be consistent across hospitals. Thus epidemiology analysis of these two data fields does not accurately describe the true population served by the hospital.

Standard Source of Payment

Hospital Comments, 3Q2005

The standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record.

In order to meet this requirement each payer identification must be categorized into the appropriate standard source of payment value. It should also be noted that the primary payer associated to the patient's encounter record may change over time. With this in mind, approximately 6% of the primary payers originally categorized as "Medicaid" were recategorized as "Medicare", 9% categorized as "Blue Cross" were recategorized as "Managed Care" and 43% originally categorized as "Commercial" were recategorized as "Managed Care". Also, 2% of the secondary payers originally as "Missing/Invalid" were recategorized as "Medicare", 4% categorized as "Commercial" were recategorized as "Managed Care" and 3% originally categorized as "Blue Cross" were recategorized as "Self-Pay".

Additionally, those payers identified contractually as both "HMO and PPO" are categorized as "Commercial PPO". Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Cost/ Revenue Codes

The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to managed care-negotiated discounts and denial of payment by insurance companies. Charges also do not reflect the actual cost to deliver the care that each patient needs.

Certification Process

Given the current certification software, there is not an efficient mechanism to edit and correct the data. In addition, due to hospital volumes, it is not feasible to perform encounter level audits and edits. Within the constraints of the current THCIC process, the data is certified to the best of our knowledge as accurate and complete given the above comments.

For example, while one physician may diagnose a patient with anemia when the patient's blood hemoglobin level falls below 9.5, another physician may not diagnose the patient with anemia until their blood hemoglobin level is below 9.0. In both situations, a diagnosis of anemia is correctly assigned, but the criteria used by the physician to determine that diagnosis was different. An 'apples to apples' comparison cannot be made,

which makes it difficult to obtain an accurate comparison of hospital or physician performance.

The codes also do not distinguish between conditions present at the time of the patient's admission to the hospital and those occurring during hospitalization. For example, if a code indicating an infection is made, it is not always possible to determine if the patient had an infection prior to admission, or developed an infection during their hospitalization.

This makes it difficult to obtain accurate information regarding things such as complication rates.

The data submitted matches the state's reporting requirements but may be incomplete due to a limitation on the number of diagnoses and procedures the state allows us to include for each patient. In other words, the state's data file may not fully represent all diagnoses treated by the hospital or all procedures performed, which can alter the true picture of a patient's hospitalization, sometimes significantly.

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code up to 99 diagnoses and 99 procedures for each patient record. The state is requiring us to submit ICD-9-CM data on each patient but has limited the number of diagnoses and procedures to the first 25 diagnoses codes and the first 25 procedure codes. As a result, the data sent by us does meet state requirements but cannot reflect all the codes an individual patient's record may have been assigned. This means also that true total volumes may not be represented by the state's data file, which therefore make percentage calculations inaccurate (i.e. mortality percentages for any given diagnosis or procedure, percentage of patients in each severity of illness category). It would be obvious; therefore, those sicker patients (more diagnoses and procedures) are less accurately reflected by the 837 format. It then stands to reason that hospitals, which treat sicker patients, are likewise less accurately reflected.

Length of Stay

The length of stay data element contained in the state's certification file is only three characters long. Thus any patients discharged with a length of stay greater than 999 days will not be accurately stored within the certification database. It is rare that patients stay longer than 999 days, therefore, it is not anticipated that this limitation will affect this data.

Admit Source data for Normal Newborn

When the Admit type is equal to 'newborn', the admit source should indicate whether the baby was a normal newborn, premature delivery, sick baby, extramural birth, or information not available. The best way to focus on severity of illness regarding an infant would be to check the infant's diagnosis at discharge, not the admitting source code. Many hospital information systems and registration process defaults to 'normal delivery' as the admission source. Therefore, admission source does not always give an accurate picture.

If admission source is used to examine length of stay or mortality for normal neonates using the admit source to identify the cases, the data will reflect premature and sick babies mixed in with the normal newborn data. Wall's Regional Hospital recommends use of ICD9 coding data to identify neonates. This methodology will ensure correct identification of the clinical status of the newborn admission.

Race/Ethnicity

As of the December 7, 2001, the THCIC Board indicated that they would be creating guidelines for use by hospitals. These guidelines will provide better clarity for the accurate collection of this data. Hospitals do

Hospital Comments, 3Q2005

not routinely collect race and ethnicity as part of the admission process, that this has been added to meet the THCIC requirement. Our admissions staff indicates that many patients are very sensitive about providing race and ethnicity information. Therefore, depending on the circumstances of the patient's admission, race and ethnicity data may be subjectively collected. Therefore, the race and ethnicity data may not provide an accurate representation of the patient population for a facility.

Standard/Non-Standard Source of Payment

The standard and non-standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement, each payer identifier must be categorized into the appropriate standard and non-standard source of payment value. These values might not accurately reflect the hospital payer information, because those payers identified contractually as both 'HMO, and PPO' are categorized as 'Commercial PPO'. Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Cost/ Revenue Codes

The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to managed care-negotiated discounts and denial of payment by insurance companies. Charges also do not reflect the actual cost to deliver the care that each patient needs.

Discharge Disposition

THR has identified a problem with a vendor (Seimens) extract that diverts some patient discharges to "home" as opposed to rehab. THR will communicate this issue and the plan to address this issue in writing to the THCIC Executive Director.

=====

PROVIDER: Baylor University Medical Center

THCIC ID: 331000

QUARTER: 3

YEAR: 2005

Certified with comments

Submission Timing

Baylor estimates that our data volumes for the calendar year time period submitted may include 96% to 100% of all cases for that time period. The state requires us to submit a snapshot of billed claims, extracted from our database approximately 20 days following the close of the calendar year quarter. Any discharged patient encounters not billed by this cut-off date will not be included in the quarterly submission file sent in.

Physician Identification

All physician license numbers and names have been validated as accurate against a physician reference file that is derived from information provided by the Texas Board of Medical Examiners. Those physicians not yet assigned a state license number at the time of data submission are given temporary numbers by the hospital for state reporting purposes. Due to the "lag" time between when the physician is licensed and when THCIC receives the information, some physicians may remain unidentified in the THCIC Practitioner Reference Files.

The THCIC minimum data set houses only two (2) physician fields; Attending Physician and Operating or Other Physician (if applicable) as reflected on the UB92 billing document. Mortality rates, case costs and other data calculated for this population of physicians may be misrepresentative.

Hospital Comments, 3Q2005

Due to the complexity of most inpatient admissions many physicians provide care to patients throughout an admission. Consulting physicians may prescribe and treat patients on behalf of the physician listed as the attending physician. Analysis of this physician information should carefully consider that significant variations in case count, case cost, and mortality may not be directly related to the care provided by the attending physician, but also reflect the varied use of consultants.

While hospitals document many treating physicians (surgeons and consultants) for each case, THCIC maintains only one (1) additional physician per case besides the Attending. "Other" physician case volumes, mortality, case costs and LOS, will frequently be inaccurate because of this limitation. Surgeons and consulting physicians beyond one that may have been involved on a case will not be credited with providing care for that patient. Analysis of "other physician" information should, therefore, take into consideration that a significant portion of treating physicians are excluded from the patient cases.

Diagnosis and Procedures

Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD-9-CM. This is mandated by the federal government and all hospitals must comply.

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code as many as 25 diagnoses and 25 procedures for each patient record. One limitation of using the ICD-9-CM system is that there does not exist a code for every possible diagnosis and procedure due to the continued evolution of medicine; new codes are added yearly as coding manuals are updated.

Normal Newborns

The best way to focus on severity of illness regarding an infant would be to check the infant's diagnosis at discharge, not the admitting source code. The actual experience of a newborn is captured elsewhere in the file, namely, in the ICD-9-CM diagnosis. Admission source does not give an accurate picture.

Mortalities

Due to insurance payer requirements, organ donor patients are readmitted and expired in the system to address the issues of separate payers. This results in double counting some "expired" cases which will increase the mortality figure reported and not accurately reflect the actual number of mortalities.

Race/Ethnicity

There are no national standards regarding patient race categorization so hospitals may not have the same designations from which patients can choose. The state has recently attempted to standardize a valid set of race codes for this project but these are not universally used by all hospitals. Each hospital must independently map their specific codes to the state's race code categories. This mapping may not be consistent across hospitals. Thus epidemiology analysis of these two data fields does not accurately describe the true population served by the hospital.

"Asian or Pacific Islander" encounters are not broken out separately but are included in the "Other" race category.

Standard Source of Payment

The standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record.

In order to meet this requirement each payer identification must be categorized into the appropriate standard source of payment value. It should also be noted that the primary payer associated to the patient's encounter

Hospital Comments, 3Q2005

record might change over time. Upon review approximately 9% of the primary payers originally categorized as "Blue Cross" were recategorized as "Managed Care", 4% "Blue Cross" were recategorized as "Medicare" and 41% originally categorized as "Commercial" was recategorized as "Managed Care". Also, 8% of the secondary payers originally categorized as "Missing/Invalid" were recategorized as "Managed Care", 3% categorized as "Blue Cross" were recategorized as "Self-Pay" and 3% originally categorized as "Commercial" were recategorized as "Self-Pay".

Additionally, those payers identified contractually as both "HMO, and PPO" are categorized as "Commercial PPO". Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Cost/ Revenue Codes

The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to managed care-negotiated discounts and denial of payment by insurance companies. Charges also do not reflect the actual cost to deliver the care that each patient needs.

Certification Process

Given the current certification software, there is not an efficient mechanism to edit and correct the data. In addition, due to hospital volumes, it is not feasible to perform encounter level audits and edits. Within the constraints of the current THCIC process, the data is certified to the best of our knowledge as accurate and complete given the above comments.

=====

PROVIDER: Cook Children's Medical Center
THCIC ID: 332000
QUARTER: 3
YEAR: 2005

Certified with comments

Cook Children's Medical Center has submitted and certified third quarter 2005 discharge encounters to the Texas Health Care Information Council with the following possible data concerns based on the required submission method.

Patient charges that were accrued before admit or after discharge were systematically excluded from the database. This can happen when a patient is pre-admitted and incurs charges to their encounter before their admit date or charges are discovered and added to the patient encounter after they are discharged. Therefore, the charges for many patient encounters are under reported.

The data structure allowed by THCIC erroneously assigns surgeons to surgical procedures they did not perform. The data structure provided by THCIC allows for one attending and one operating physician assignment. However, patients frequently undergo multiple surgeries where different physicians perform multiple procedures. Assigning all of those procedures to a single 'operating physician' will frequently attribute surgeries to the wrong physician. THCIC chooses to only assign one surgeon to a patient encounter, not to each procedure.

Furthermore, the data structure established by THCIC allows for a limited number of diagnoses and procedures. Patients with more than the limit for diagnoses or procedures will be missing information from the database. This is especially true in complex cases where a patient has multiple major illnesses and multiple surgeries over an extended stay.

Hospital Comments, 3Q2005

=====

PROVIDER: Brackenridge Hospital
THCIC ID: 335000
QUARTER: 3
YEAR: 2005

Certified with comments

As the public teaching hospital in Austin and Travis County, Brackenridge serves patients who are often unable to access primary care. It is more likely that these patients will present in the later more complex stage of their disease. Brackenridge has a perinatal program that serves a population that includes mothers with late or no prenatal care. Brackenridge is also a regional referral center, receiving patient transfers from hospitals not able to serve a complex mix of patients. Treatment of these very complex, seriously ill patients increases the hospital's costs of care, length of stay and mortality rates.

As the Regional Trauma Center, Brackenridge serves severely injured patients. Lengths of stay and mortality rates are most appropriate compared to other trauma centers.

All physician license numbers and names have been validated with the physician and the Texas State Board of Medical Examiner web-site as accurate but some remain unidentified in the THCIC Practitioner References Files.

These data are submitted by the hospital as their best effort to meet statutory requirements

=====

PROVIDER: Childrens Hospital of Austin
THCIC ID: 335001
QUARTER: 3
YEAR: 2005

Certified with comments

Children's Hospital of Austin is the only children's hospital in the Central Texas Region. Children's serves severely ill and/or injured children requiring intensive resources which increases the hospital's costs of care, lengths of stay and mortality rates. In addition, the hospital includes a Neonatal Intensive Care Unit (NICU) which serves very seriously ill infants, which substantially increases costs of care, lengths of stay and mortality rates.

All physician license numbers and names have been validated with the physician and the Texas State Board of Medical Examiner website as accurate but some remain unidentified in the THCIC Practitioner Reference Files.

These data are submitted by the hospital as their best effort to meet statutory requirements.

YEAR: 2005

Certified with comments

Submission Timing

Baylor estimates that our data volumes for the calendar year time period submitted may include 96% to 100% of all cases for that time period. The state requires us to submit a snapshot of billed claims, extracted from our database approximately 20 days following the close of the calendar year quarter. Any discharged patient encounters not billed by this cut-off date will not be included in the quarterly submission file sent in.

Physician Identification

All physician license numbers and names have been validated as accurate against a physician reference file that is derived from information provided by the Texas Board of Medical Examiners. Those physicians not yet assigned a state license number at the time of data submission are given temporary numbers by the hospital for state reporting purposes. Due to the "lag" time between when the physician is licensed and when THCIC receives the information, some physicians may remain unidentified in the THCIC Practitioner Reference Files.

The THCIC minimum data set houses only two (2) physician fields; Attending Physician and Operating or Other Physician (if applicable) as reflected on the UB92 billing document. Mortality rates, case costs and other data calculated for this population of physicians may be misrepresentative. Due to the complexity of most inpatient admissions many physicians provide care to patients throughout an admission. Consulting physicians may prescribe and treat patients on behalf of the physician listed as the attending physician. Analysis of this physician information should carefully consider that significant variations in case count, case cost, and mortality may not be directly related to the care provided by the attending physician, but also reflect the varied use of consultants.

While hospitals document many treating physicians (surgeons and consultants) for each case, THCIC maintains only one (1) additional physician per case besides the Attending. "Other" physician case volumes, mortality, case costs and LOS, will frequently be inaccurate because of this limitation. Surgeons and consulting physicians beyond one that may have been involved on a case will not be credited with providing care for that patient. Analysis of "other physician" information should, therefore, take into consideration that a significant portion of treating physicians are excluded from the patient cases.

Diagnosis and Procedures

Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD-9-CM. This is mandated by the federal government and all hospitals must comply.

The codes are assigned based on documentation in the patient's chart and

Hospital Comments, 3Q2005

are used by hospitals for billing purposes. The hospital can code as many as 25 diagnoses and 25 procedures for each patient record. One limitation of using the ICD-9-CM system is that there does not exist a code for every possible diagnosis and procedure due to the continued evolution of medicine; new codes are added yearly as coding manuals are updated.

Medical Record Number

Due to a new system implementation, the Medical Record format was changed from alphanumeric to numeric. Starting 4QTR2004 forward, the leading digit of "M" was dropped leaving the remaining number as the Medical Record number. This change in format will need to be considered when calculating any readmission rates or the rates will be erroneously lower.

Race/Ethnicity

There are no national standards regarding patient race categorization so hospitals may not have the same designations from which patients can choose. The state has recently attempted to standardize a valid set of race codes for this project but these are not universally used by all hospitals. Each hospital must independently map their specific codes to the state's race code categories. This mapping may not be consistent across hospitals. Thus epidemiology analysis of these two data fields does not accurately describe the true population served by the hospital.

Standard Source of Payment

The standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement each payer identification must be categorized into the appropriate standard source of payment value. It should also be noted that the primary payer associated to the patient's encounter record might change over time. Upon review, approximately 10% of the primary payers originally categorized as "Blue Cross" were recategorized as "Managed Care", and 45% categorized as "Commercial" were recategorized as "Managed Care". Also, approximately 3% of the secondary payers originally categorized as "Missing/Invalid" were recategorized as "Managed Care", 6% categorized as "Commercial" were recategorized as "Managed Care", and 3% originally categorized as "Blue Cross" were recategorized as "Self-Pay".

Additionally, those payers identified contractually as both "HMO, and PPO" are categorized as "Commercial PPO". Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Cost/ Revenue Codes

The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to managed care-negotiated discounts and denial of payment by insurance companies. Charges also do not reflect the actual cost to deliver the care that each patient needs.

Certification Process

Given the current certification software, there is not an efficient mechanism to edit and correct the data. In addition, due to hospital volumes, it is not feasible to perform encounter level audits and edits. JPS Health Network
Comments on THCIC Data Submission
For
3rd Quarter 2005

Introduction

John Peter Smith Hospital (JPSH) is operated by the JPS Health Network under the auspices of the Tarrant County Hospital District. The JPS Health Network is accredited by the Joint Commission on Accreditation of Health Care Organizations. In addition, JPSH holds JCAHO accreditation as a hospital.

JPSH was the first Texas Department of Health certified Level II Trauma Center in Tarrant County and includes the only 24-hour, seven-day a week psychiatric emergency center in the area. The hospital's special services include intensive care for adults and newborns, a special AIDS treatment center, a skilled nursing unit, a full-range of obstetrical and gynecological services, inpatient care for patients of all ages and an inpatient mental health treatment facility.

JPSH is a major teaching hospital offering or providing through co-operative arrangements postdoctoral training in family medicine, orthopedics, obstetrics and gynecology, psychiatry, surgery, oral and maxillofacial surgery, radiology and podiatry.

In addition to JPSH, the JPS Health Network operates community-based health centers located in medically underserved areas of Tarrant County, school-based health centers, special outpatient programs for pregnant women and a wide range of wellness education programs.

Data Comments

This inpatient data was submitted to meet requirements of the State of Texas for reporting third quarter 2005 inpatient hospital discharge data.

The data used by the Texas Health Care Information Collection (THCIC) is administrative and collected for billing purposes, and it should be noted that the data is a "snapshot" at the time of the file production and not of the final disposition of claim data to the payor. It is not clinical data and should be cautiously used to evaluate health care quality. Also, the use of only one quarter's data to infer statistical meaning can lead to misinterpretation.

Charges

Because of changes in payor categories, information about insurance or patient type may not be accurate. Specifically, charity care may not be accurately reflected in the new reporting categories.

There is an inherent limitation in our Siemens billing system. At the point during a specific patient stay that the system's maximum number of entries is reached, a certain number of defined charges are captured at a summary level and then deleted from the system to make room for additional charges. At JPS, this would impact the charges for a very limited number of patients for whom we will attempt a manual adjustment. Because of this deficiency, charge information may be understated.

Physician Master File

A patient may have several attending physicians throughout his/her course of stay due to the rotation of physicians to accommodate teaching responsibilities.

Hospital Comments, 3Q2005

This rotation may result in an under-representation of true attending physicians.

Length of Stay

Some of our patients require increased length of stay. Reasons for increased length of stay are:

" JPSH is a major trauma center, many patients have suffered multiple system trauma.

" JPSH operates a SNF (skilled nursing facility) unit.

" JPSH operates an inpatient psychiatric unit in which many patients are court-committed and length of stay is determined by the legal system.

" Many of our patients have limited financial resources making it impossible for them to secure intermediate care. This, in turn, often limits their discharge options and they remain at JPSH longer than would otherwise be the case.

We are certifying the State data file, with comments.

YEAR: 2005

Certified with comments

*Comments not received by THCIC

=====

PROVIDER: Arlington Memorial Hospital

THCIC ID: 422000

QUARTER: 3

YEAR: 2005

Certified with comments

This data is administrative data which hospitals collect for billing purposes.

Administrative data may not accurately represent the clinical details of an encounter.

If a medical record is unavailable for coding, the encounter is not billed and is not included in the data submission. This represents a rare event that is less than 1% of the encounter volume.

Diagnosis and Procedures

Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD-9-CM. The federal government mandates this.

One limitation of using the ICD-9-CM system is that a code for every possible diagnosis and procedure does not exist due to the continued evolution of medicine; new codes are added yearly as coding manuals are updated.

The hospital complies with the guidelines for assigning these diagnosis codes. However, this is often driven by physician's subjective criteria for defining a diagnosis. For example, while one physician may diagnose a patient with anemia when the patient's blood hemoglobin level falls below 9.5, another physician may not diagnose the patient with anemia until their blood hemoglobin level is below 9.0. In both situations, a diagnosis of anemia is correctly assigned, but the criteria used by the physician to determine that diagnosis was different. An "apples to apples" comparison cannot be made, making it difficult to obtain an accurate comparison of hospital or physician performance.

Hospital Comments, 3Q2005

The codes also do not distinguish between conditions present at the time of the patient's admission to the hospital and those occurring during hospitalization. For example, if a code indicating an infection is assigned, it is not always possible to determine if the patient had an infection prior to admission, or developed an infection during their hospitalization.

This makes it difficult to obtain accurate information regarding things such as complication rates. One patient was incorrectly coded with a diagnosis of accidental operative laceration. This coding error has since been corrected.

Race/Ethnicity

During the hospital's registration process, many patients refuse to answer these questions and therefore, the registration clerks are forced to use their best judgment or answer unknown to these questions.

Any assumptions based on race or ethnicity will be inaccurate.

Standard/Non-Standard Source of Payment

The standard and non-standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement, each payer identification must be categorized into the appropriate standard and non-standard source of payment value. These values might not accurately reflect the hospital payer information, because those payers identified correctly in the hospital's computer system as both "HMO" and "PPO" are categorized as "Commercial/PPO" in the state file. Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Revenue

The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received. Typically actual payments are much less than charges due to bad debts, charity adjustments, managed care-negotiated discounts, denial of payment by insurance companies and government programs that pay less than billed charges.

Charity Care

THCIC assumes charity patients are identified in advance and reports charges in a charity financial class as the amount of charity care provided in a given period. In actuality, charity patients are usually not identified until after care has been provided and in the hospital's computer system charity care is recorded as an adjustment to the patient account, not in a separate financial class. Therefore, the THCIC database shows no charity care provided by the hospital for the quarter when in fact the hospital provided \$4,937,985 in charity care during this time period.

Certification Process

Due to the infancy of the state reporting process and the state's computer system development, the certification process is not as complete and as thorough as all parties would like to see in the future. Within the constraints of the current THCIC process, the data is certified to the best of our knowledge as accurate.

Data Content

This data is administrative data, which hospitals collect for billing purposes. Administrative data may not accurately represent the clinical details of an encounter.

The state requires us to submit inpatient claims, by quarter year, gathered from a form called an UB92, in a standard government format called HCFA 837 EDI electronic claim format. Then the state specifications require additional data elements to be included over and above that. Adding those additional data places programming burdens on the hospital since it is 'over and above' the actual hospital billing process. Errors can occur due to this additional programming, but the public should not conclude that billing data sent to our payers is inaccurate. These errors have been corrected to the best of our knowledge.

If a medical record is unavailable for coding the encounter is not billed and is not included in the data submission. This represents a rare event that is less than 1% of the encounter volume.

Diagnosis and Procedures

Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD 9 CM. This is mandated by the federal government.

The hospital complies with the guidelines for assigning these diagnosis codes, however, this is often driven by physician's subjective criteria for defining a diagnosis. For example, while one physician may diagnose a patient with anemia when the patient's blood hemoglobin level falls below 9.5, another physician may not diagnose the patient with anemia until their blood hemoglobin level is below 9.0. In both situations, a diagnosis of anemia is correctly assigned, but the criteria used by the physician to determine that diagnosis was different. An 'apples to apples' comparison cannot be made, which makes it difficult to obtain an accurate comparison of hospital or physician performance.

The codes also do not distinguish between conditions present at the time of the patient's admission to the hospital and those occurring during hospitalization. For example, if a code indicating an infection is made, it is not always possible to determine if the patient had an infection prior to admission, or developed an infection during their hospitalization. This makes it difficult to obtain accurate information regarding things

such as complication rates.

The data submitted matches the state's reporting requirements but may be incomplete due to a limitation on the number of diagnoses and procedures the state allows us to include for each patient. In other words, the state's data file may not fully represent all diagnoses treated by the hospital or all procedures performed, which can alter the true picture of a patient's hospitalization, sometimes significantly.

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code up to 99 diagnoses and 99 procedures for each patient record. The state is requiring us to submit ICD-9-CM data on each patient but has limited the number of diagnoses and procedures to the first 25 diagnoses codes and the first 25 procedure codes. As a result, the data sent by us does meet state requirements but cannot reflect all the codes an individual patient's record may have been assigned. This means also that true total volumes may not be represented by the state's data file, which therefore make percentage calculations inaccurate (i.e. mortality percentages for any given diagnosis or procedure, percentage of patients in each severity of illness category). It would be obvious; therefore, those sicker patients (more diagnoses and procedures) are less accurately reflected by the 837 format. It then stands to reason that hospitals, which treat sicker patients, are likewise less accurately reflected.

Length of Stay

The length of stay data element contained in the state's certification file is only three characters long. Thus any patients discharged with a length of stay greater than 999 days will not be accurately stored within the certification database. It is rare that patients stay longer than 999 days, therefore, it is not anticipated that this limitation will affect this data.

Admit Source data for Normal Newborn

When the Admit type is equal to 'newborn', the admit source should indicate whether the baby was a normal newborn, premature delivery, sick baby, extramural birth, or information not available. The best way to focus on severity of illness regarding an infant would be to check the infant's diagnosis at discharge, not the admitting source code. Many hospital information systems and registration process defaults to 'normal delivery' as the admission source. Therefore, admission source does not always give an accurate picture.

If admission source is used to examine length of stay or mortality for normal neonates using the admit source to identify the cases, the data will reflect premature and sick babies mixed in with the normal newborn data. Presbyterian Hospital of Dallas recommends use of ICD9 coding data to identify neonates. This methodology will ensure correct identification of the clinical status of the newborn admission.

Race/Ethnicity

As of the December 7, 2001, the THCIC Board indicated that they would be creating guidelines for use by hospitals. These guidelines will provide better clarity for the accurate collection of this data. Hospitals do not routinely collect race and ethnicity as part of the admission process, that this has been added to meet the THCIC requirement. Our admissions staff indicates that many patients are very sensitive about providing race and ethnicity information. Therefore, depending on the circumstances of the patient's admission, race and ethnicity data may be subjectively collected. Therefore, the race and ethnicity data may not provide an accurate representation of the patient population for a facility.

Standard/Non-Standard Source of Payment

Hospital Comments, 3Q2005

The standard and non-standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement, each payer identifier must be categorized into the appropriate standard and non-standard source of payment value. These values might not accurately reflect the hospital payer information, because those payers identified contractually as both 'HMO, and PPO' are categorized as 'Commercial PPO'. Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Cost/ Revenue Codes

The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to managed care-negotiated discounts and denial of payment by insurance companies. Charges also do not reflect the actual cost to deliver the care that each patient needs.

Discharge Disposition

THR has identified a problem with a vendor (Seimens) extract that diverts some patient discharges to "home" as opposed to rehab. THR will communicate this issue and the plan to address this issue in writing to the THCIC Executive Director.

KNAPP MEDICAL CENTER THCIC DISCLAIMER STATEMENT AND COMMENTS FOR THIRD QUARTER 2005

DISCLAIMER STATEMENT

Knapp Medical Center has compiled the information set forth above in compliance with the procedures for THCIC certification process. All information that is being submitted has been obtained from Knapp Medical Center's records. The information being provided by Knapp Medical Center is believed to be true and accurate at the time of this submission. The information being submitted has been taken from other records kept by Knapp Medical Center and the codes typically used in those records do not conform to the codes required in THCIC certification process. Knapp Medical Center has used its best efforts and submits this information in good faith compliance with THCIC certification process. Any variances or discrepancies in the information provided is the result of Knapp Medical Center's good faith effort to conform the information regularly compiled with the information sought by THCIC.

CHARITY COMMENT

Knapp Medical Center has a long tradition of providing charity care for the population it serves. Prior to designation as charity, program qualification attempts are exhausted. This results in designation of charity being made after the patient is discharged, sometimes many months. Patient specific charity amounts are not available, therefore, at the time of submission of data to THCIC. Due to the impracticality at this time of identifying specific patients designated as charity and submitting corrections, the aggregate amount of charity provided during the Third Quarter 2005 was \$1,094,432.70 for 38 patients.

=====

PROVIDER: Seton Medical Center
THCIC ID: 497000
QUARTER: 3
YEAR: 2005

Certified with comments

Seton Medical Center has a transplant program and Neonatal Intensive Care Unit (NICU). Hospitals with transplant programs generally serve a more seriously ill patient, increasing costs, and mortality rates. Neonatal Intensive Care Units serve very seriously ill infants substantially increasing costs, lengths of stay and mortality rates. As a regional referral center and tertiary care hospital for cardiac and critical care services, Seton Medical Center receives numerous transfers from hospitals not able to serve a more complex mix of patients. The increased patient complexity may lead to longer lengths of stay, higher costs and increased mortality.

All physician license numbers and names have been validated with the Physician and the Texas State Board of Medical Examiner website as accurate but some remain unidentified in the THCIC Practitioner Reference Files.

Hospital Comments, 3Q2005

These data are submitted by the hospital as their best effort to meet statutory requirements.

=====

PROVIDER: Baylor Regional Medical Center-Grapevine
THCIC ID: 513000
QUARTER: 3
YEAR: 2005

Certified with comments

Submission Timing

Baylor estimates that our data volumes for the calendar year time period submitted may include 96% to 100% of all cases for that time period. The state requires us to submit a snapshot of billed claims, extracted from our database approximately 20 days following the close of the calendar year quarter. Any discharged patient encounters not billed by this cut-off date will not be included in the quarterly submission file sent in.

Physician Identification

All physician license numbers and names have been validated as accurate against a physician reference file that is derived from information provided by the Texas Board of Medical Examiners. Those physicians not yet assigned a state license number at the time of data submission are given temporary numbers by the hospital for state reporting purposes. Due to the "lag" time between when the physician is licensed and when THCIC receives the information, some physicians may remain unidentified in the THCIC Practitioner Reference Files.

The THCIC minimum data set houses only two (2) physician fields; Attending Physician and Operating or Other Physician (if applicable) as reflected on the UB92 billing document. Mortality rates, case costs and other data calculated for this population of physicians may be misrepresentative. Due to the complexity of most inpatient admissions many physicians provide care to patients throughout an admission. Consulting physicians may prescribe and treat patients on behalf of the physician listed as the attending physician. Analysis of this physician information should carefully consider that significant variations in case count, case cost, and mortality may not be directly related to the care provided by the attending physician, but also reflect the varied use of consultants.

While hospitals document many treating physicians (surgeons and consultants) for each case, THCIC maintains only one (1) additional physician per case besides the Attending. "Other" physician case volumes, mortality, case costs and LOS, will frequently be inaccurate because of this limitation. Surgeons and consulting physicians beyond one that may have been involved on a case will not be credited with providing care for that patient. Analysis of "other physician" information should, therefore, take into consideration that a significant portion of treating physicians are excluded from the patient cases.

Diagnosis and Procedures

Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD-9-CM. This is mandated by the federal government and all hospitals must comply.

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code as many as 25 diagnoses and 25 procedures for each patient record. One limitation of using the ICD-9-CM system is that there does not exist a code for every possible diagnosis and procedure due to the continued evolution of medicine; new codes are added yearly as coding manuals are updated.

Race/Ethnicity

There are no national standards regarding patient race categorization so hospitals may not have the same designations from which patients can choose. The state has recently attempted to standardize a valid set of race codes for this project but these are not universally used by all hospitals. Each hospital must independently map their specific codes to the state's race code categories. This mapping may not be consistent across hospitals. Thus epidemiology analysis of these two data fields does not accurately describe the true population served by the hospital.

Standard Source of Payment

The standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement each payer identification must be categorized into the appropriate standard source of payment value. It should also be noted that the primary payer associated to the patient's encounter record may change over time. With this in mind, approximately 16% of the primary payors originally categorized as "Blue Cross" were recategorized as "Managed Care" and 62% originally categorized as "Commercial" were recategorized as "Managed Care". Also approximately 4% of the secondary payors originally categorized as "Missing/Invalid" were recategorized as "Managed Care", 3% categorized as "Blue Cross" were recategorized as "Self-Pay" and 2% categorized as "Commercial" were recategorized as "Medicare".

Additionally, those payers identified contractually as both "HMO and PPO" are categorized as "Commercial PPO". Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Cost/ Revenue Codes

The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to managed care-negotiated discounts and denial of payment by insurance companies. Charges also do not reflect the actual cost to deliver the care that each patient needs.

Certification Process

Given the current certification software, there is not an efficient mechanism to edit and correct the data. In addition, due to hospital volumes, it is not feasible to perform encounter level audits and edits. Within the constraints of the current THIC process, the data is certified to the best of our knowledge as accurate and complete given the above comments.

=====

PROVIDER: Richardson Regional Medical Center
THIC ID: 549000
QUARTER: 3
YEAR: 2005

Certified with comments

Diagnosis and Procedures

The UB92 claims data format which the state is requiring hospitals to submit, only accepts the first 9 diagnosis codes and the first 6 procedure codes. As a result, the data from the UB92 will not reflect every code from an individual patient record that was assigned. Thus the state's data file may not fully represent all diagnoses treated, or all procedures performed, by the hospital. Therefore total volumes and severity of illness indicators represented by the state required UB92 data file, may not be accurate, making percentage calculations inaccurate.

Race/Ethnicity

Hospital Comments, 3Q2005

Although race/ethnicity is an admission field, the hospital does sometimes encounter difficulties in obtaining race/ethnicity information. These difficulties are due to a variety of reasons, including information not supplied by the patient. Thus analysis of these two data fields may not accurately describe the true population served by the hospital. The hospital does not discriminate based on race, color, ethnicity, gender or national origin.

Cost/ Revenue Codes

The state data files will include charge information. It is important to understand that charges do not equal payments received by the hospital. Payments due to managed care-negotiated discounts and denial of payment by insurance companies, will always be much less than charges. Also, charges do not reflect the actual cost for care that each patient receives.

Quality and Validity of the process

Processes are in place to verify the integrity and validity of the claims data. For this reason, steps are taken to ensure that the information sent to the state mirrors what is contained within the hospital's source system. On rare occasions, if a case was not billed prior to data submission, that patient will not be included in the current submission, nor will it be included in any future data submissions. An example of why this would occur, is the patient is discharged on the last day of the calendar quarter, and not allowing adequate time to issue a bill or the case was extremely complex requiring extra time for coding.

Consulting physicians may prescribe and treat patients on behalf of the physician listed as the attending physician. Analysis of this physician information should carefully consider that significant variations in case count, case cost, and mortality may not be directly related to the care provided by the attending physician, but also reflect the varied use of consultants.

While hospitals document many treating physicians (surgeons and consultants) for each case, THCIC maintains only one (1) additional physician per case besides the Attending. "Other" physician case volumes, mortality, case costs and LOS, will frequently be inaccurate because of this limitation. Surgeons and consulting physicians beyond one that may have been involved on a case will not be credited with providing care for that patient. Analysis of "other physician" information should, therefore, take into consideration that a significant portion of treating physicians are excluded from the patient cases.

Diagnosis and Procedures

BSH is different from most hospitals submitting data to the state. We provide complex medical services to patients who have experienced a catastrophic illness and/or complex body system failure that requires coordinated, intensive treatment and care. Many of the patients have received emergency care and stabilizing treatment at another acute care hospital. They are admitted to BSH to continue their recovery and focus on improving their medical condition and/or functional ability in order to improve their quality of life to the fullest extent possible.

Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD-9-CM. This is mandated by the federal government and all hospitals must comply.

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code as many as 25 diagnoses and 25 procedures for each patient record. One limitation of using the ICD-9-CM system is that there does not exist a code for every possible diagnosis and procedure due to the continued evolution of medicine; new codes are added yearly as coding manuals are updated.

Patient diagnoses and procedures for a particular hospital stay at BSH are assigned ICD-9-CM codes according to standard coding practices. Because of our unique patient population, however, comparisons against all other hospitals in the database would not be accurate. It is unclear whether coding practice across all long term acute care hospitals is consistent, so caution should be used when making comparisons and/or drawing conclusions from the data.

Length of Stay

Medical recovery at BSH can be a long, arduous process depending on the severity of illness or injury. Due to the unique nature of medically complex patients, length of stay data cannot accurately be compared with data from hospitals that primarily treat an acute or emergent episode of illness or injury.

Admission Source

The majority of entries for "Admission Source" were coded incorrectly (erroneously reflecting that our main source of admission was "Physician Referral"). The majority of admission sources are "Transfer from Hospital".

Hospital Comments, 3Q2005

This was due to a procedural error which has now been corrected.

Race/Ethnicity

There are no national standards regarding patient race categorization so hospitals may not have the same designations from which patients can choose. The state has recently attempted to standardize a valid set of race codes for this project but these are not universally used by all hospitals. Each hospital must independently map their specific codes to the state's race code categories. This mapping may not be consistent across hospitals. Thus epidemiology analysis of these two data fields does not accurately describe the true population served by the hospital. "Asian or Pacific Islander" encounters are not broken out separately but are included in the "Other" race category.

Standard Source of Payment

The standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement each payer identification must be categorized into the appropriate standard source of payment value. It should also be noted that the primary payer associated to the patient's encounter record might change over time. Upon review approximately 4% of the primary payers originally categorized as "Blue Cross" were recategorized as "Managed Care" and 11% originally categorized as "Commercial" were recategorized as "Managed Care". Also, 2% of the secondary payers originally categorized as "Missing/Invalid" were recategorized as "Self-Pay", 5% originally categorized as "Blue Cross" were recategorized as "Managed Care", 9% originally categorized as "Commercial" were recategorized as "Managed Care" and 3% originally categorized as "Blue Cross" were recategorized as "Medicare".

Additionally, those payers identified contractually as both "HMO and PPO" are categorized as "Commercial PPO". Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Cost/ Revenue Codes

The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to managed care-negotiated discounts and denial of payment by insurance companies. Charges also do not reflect the actual cost to deliver the care that each patient needs.

Certification Process

Given the current certification software, there is not an efficient mechanism to edit and correct the data. In addition, due to hospital volumes, it is not feasible to perform encounter level audits and edits. Within the constraints of the current THCIC process, the data is certified to the best of our knowledge as accurate and complete given the above comments.

=====

PROVIDER: Bayl or Specialty Hospital
THCIC ID: 586001
QUARTER: 3
YEAR: 2005

Certified with comments

Submission Timing

Bayl or Specialty Hospital -Garland (BSH) estimates that our data volumes for the calendar year time period submitted may include 96 to 100% of all cases for that time period. The state requires us to submit a snapshot of billed claims, extracted from our database approximately 20 days following the close of the calendar year quarter. Any discharged patient encounters

not billed by this cut-off date will not be included in the quarterly submission file sent in.

Physician Identification

All physician license numbers and names have been validated as accurate against a physician reference file that is derived from information provided by the Texas Board of Medical Examiners. Those physicians not yet assigned a state license number at the time of data submission are given temporary numbers by the hospital for state reporting purposes. Due to the "lag" time between when the physician is licensed and when THCIC receives the information, some physicians may remain unidentified in the THCIC Practitioner Reference Files.

The THCIC minimum data set houses only two (2) physician fields; Attending Physician and Operating or Other Physician (if applicable) as reflected on the UB92 billing document. Mortality rates, case costs and other data calculated for this population of physicians may be misrepresentative. Due to the complexity of most inpatient admissions many physicians provide care to patients throughout an admission. Consulting physicians may prescribe and treat patients on behalf of the physician listed as the attending physician. Analysis of this physician information should carefully consider that significant variations in case count, case cost, and mortality may not be directly related to the care provided by the attending physician, but also reflect the varied use of consultants.

While hospitals document many treating physicians (surgeons and consultants) for each case, THCIC maintains only one (1) additional physician per case besides the Attending. "Other" physician case volumes, mortality, case costs and LOS, will frequently be inaccurate because of this limitation. Surgeons and consulting physicians beyond one that may have been involved on a case will not be credited with providing care for that patient. Analysis of "other physician" information should, therefore, take into consideration that a significant portion of treating physicians are excluded from the patient cases.

Diagnosis and Procedures

BSH is different from most hospitals submitting data to the state. QUARTER: 3
YEAR: 2005

Certified with comments

Christus St. John Hospital certified the data, but could not account for 4 patients due to processing the patients after the data was submitted.

During this time period Christus St. John Hospital provided charity care for 133 patients with total charges (-\$1,600,724.77) dollars. The system didn't identify these patients.

Christus St. John data didn't correspond to the newborn admission, according to our data there were 3 premature infants, 13 sick infants and 129 normal newborns.

Data Content

This data is administrative data, which hospitals collect for billing purposes. Administrative data may not accurately represent the clinical details of an encounter.

The state requires us to submit inpatient claims, by quarter year, gathered from a form called an UB92, in a standard government format called HCFA 837 EDI electronic claim format. Then the state specifications require

Hospital Comments, 3Q2005

additional data elements to be included over and above that. Adding those additional data places programming burdens on the hospital since it is 'over and above' the actual hospital billing process. Errors can occur due to this additional programming, but the public should not conclude that billing data sent to our payers is inaccurate. These errors have been corrected to the best of our knowledge.

If a medical record is unavailable for coding the encounter is not billed and is not included in the data submission. This represents a rare event that is less than 1% of the encounter volume.

Diagnosis and Procedures

Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD 9 CM. This is mandated by the federal government.

The hospital complies with the guidelines for assigning these diagnosis codes, however, this is often driven by physician's subjective criteria for defining a diagnosis. For example, while one physician may diagnose a patient with anemia when the patient's blood hemoglobin level falls below 9.5, another physician may not diagnose the patient with anemia until their blood hemoglobin level is below 9.0. In both situations, a diagnosis of anemia is correctly assigned, but the criteria used by the physician to determine that diagnosis was different. An 'apples to apples' comparison cannot be made, which makes it difficult to obtain an accurate comparison of hospital or physician performance.

The codes also do not distinguish between conditions present at the time of the patient's admission to the hospital and those occurring during hospitalization. For example, if a code indicating an infection is made, it is not always possible to determine if the patient had an infection prior to admission, or developed an infection during their hospitalization.

This makes it difficult to obtain accurate information regarding things such as complication rates.

The data submitted matches the state's reporting requirements but may be incomplete due to a limitation on the number of diagnoses and procedures the state allows us to include for each patient. In other words, the state's data file may not fully represent all diagnoses treated by the hospital or all procedures performed, which can alter the true picture of a patient's hospitalization, sometimes significantly.

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code up to 99 diagnoses and 99 procedures for each patient record. The state is requiring us to submit ICD-9-CM data on each patient but has limited the number of diagnoses and procedures to the first 25 diagnoses codes and the first 25 procedure codes. As a result, the data sent by us does meet state requirements but cannot reflect all the codes an individual patient's record may have been assigned. This means also that true total volumes may not be represented by the state's data file, which therefore make percentage calculations inaccurate (i.e. mortality percentages for any given diagnosis or procedure, percentage of patients in each severity of illness category). It would be obvious; therefore, those sicker patients (more diagnoses and procedures) are less accurately reflected by the 837 format. It then stands to reason that hospitals, which treat sicker patients, are likewise less accurately reflected.

Length of Stay

The length of stay data element contained in the state's certification file is only three characters long. Thus any patients discharged with a length of stay greater than 999 days will not be accurately stored within the certification database. It is rare that patients stay longer than

999 days, therefore, it is not anticipated that this limitation will affect this data.

Admit Source data for Normal Newborn

When the Admit type is equal to 'newborn', the admit source should indicate whether the baby was a normal newborn, premature delivery, sick baby, extramural birth, or information not available. The best way to focus on severity of illness regarding an infant would be to check the infant's diagnosis at discharge, not the admitting source code. Many hospital information systems and registration process defaults to 'normal delivery' as the admission source. Therefore, admission source does not always give an accurate picture.

If admission source is used to examine length of stay or mortality for normal neonates using the admit source to identify the cases, the data will reflect premature and sick babies mixed in with the normal newborn data. Harris Methodist Southwest recommends use of ICD9 coding data to identify neonates. This methodology will ensure correct identification of the clinical status of the newborn admission.

Race/Ethnicity

As of the December 7, 2001, the THCIC Board indicated that they would be creating guidelines for use by hospitals. These guidelines will provide better clarity for the accurate collection of this data. Hospitals do not routinely collect race and ethnicity as part of the admission process, that this has been added to meet the THCIC requirement. Our admissions staff indicates that many patients are very sensitive about providing race and ethnicity information. Therefore, depending on the circumstances of the patient's admission, race and ethnicity data may be subjectively collected. Therefore, the race and ethnicity data may not provide an accurate representation of the patient population for a facility.

Standard/Non-Standard Source of Payment

The standard and non-standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement, each payer identifier must be categorized into the appropriate standard and non-standard source of payment value. These values might not accurately reflect the hospital payer information, because those payers identified contractually as both 'HMO, and PPO' are categorized as 'Commercial PPO'. Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Cost/ Revenue Codes

The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to managed care-negotiated discounts and denial of payment by insurance companies. Charges also do not reflect the actual cost to deliver the care that each patient needs.

Discharge Disposition

THR has identified a problem with a vendor (Seimens) extract that diverts some patient discharges to "home" as opposed to rehab. THR will communicate this issue and the plan to address this issue in writing to the THCIC Executive Director.

QUARTER: 3
YEAR: 2005

Elect not to certify

=====

PROVIDER: Baylor Institute for Rehab@Gaston Episcopal Hosp
THCIC ID: 642000
QUARTER: 3
YEAR: 2005

Certified with comments

Submission Timing

Baylor Institute for Rehabilitation (BIR) estimates that our data volumes for the calendar year time period submitted may include 96% to 100% of all cases for that time period. The state requires us to submit a snapshot of billed claims, extracted from our database approximately 20 days following the close of the calendar year quarter. Any discharged patient encounters not billed by this cut-off date will not be included in the quarterly submission file sent in. BIR has a 10-day billing cycle; therefore we will have a higher percentage of incomplete encounters than hospitals with a 30-day billing cycle.

Physician Identification

All physician license numbers and names have been validated as accurate against a physician reference file that is derived from information provided by the Texas Board of Medical Examiners. Those physicians not yet assigned a state license number at the time of data submission are given temporary numbers by the hospital for state reporting purposes. Due to the "lag" time between when the physician is licensed and when THCIC receives the information, some physicians may remain unidentified in the THCIC Practitioner Reference Files.

The THCIC minimum data set houses only two (2) physician fields; Attending Physician and Operating or Other Physician (if applicable) as reflected on the UB92 billing document. Mortality rates, case costs and other data calculated for this population of physicians may be misrepresentative. Due to the complexity of most inpatient admissions many physicians provide care to patients throughout an admission. Consulting physicians may prescribe and treat patients on behalf of the physician listed as the attending physician. Analysis of this physician information should carefully consider that significant variations in case count, case cost, and mortality may not be directly related to the care provided by the attending physician, but also reflect the varied use of consultants.

While hospitals document many treating physicians (surgeons and consultants) for each case, THCIC maintains only one (1) additional physician per case besides the Attending. "Other" physician case volumes, mortality, case costs and LOS, will frequently be inaccurate because of this limitation. Surgeons and consulting physicians beyond one that may have been involved on a case will not be credited with providing care for that patient. Analysis of "other physician" information should, therefore, take into consideration that a significant portion of treating physicians are excluded from the patient cases.

Diagnosis and Procedures

BIR is different from most hospitals submitting data to the state. We provide comprehensive medical rehabilitation services to patients who have lost physical or mental functioning as a result of illness or injury. Many of these patients have already received emergency care and stabilizing treatment at an acute care hospital. They are admitted to BIR to continue their recovery and focus on improving their functional ability in order to improve their quality of life to the fullest extent possible.

Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification

of Disease, or ICD-9-CM. This is mandated by the federal government and all hospitals must comply.

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code as many as 25 diagnoses and 25 procedures for each patient record. One limitation of using the ICD-9-CM system is that there does not exist a code for every possible diagnosis and procedure due to the continued evolution of medicine; new codes are added yearly as coding manuals are updated.

Patient diagnoses and procedures for a particular hospital stay at BIR are assigned ICD-9-CM codes according to standard coding practices. Because of our unique patient population, however, comparisons against all other hospitals in the database would not be accurate. It is unclear whether coding practice across all comprehensive medical rehabilitation facilities is consistent, so caution should be used when making comparisons and/or drawing conclusions from the data.

Length of Stay

Medical rehabilitation at BIR can be a long, arduous process depending on the severity of illness or injury. Due to the unique nature of rehabilitation services, length of stay data cannot accurately be compared with data from hospitals that primarily treat an acute or emergent episode of illness or injury.

Race/Ethnicity

There are no national standards regarding patient race categorization so hospitals may not have the same designations from which patients can choose. The state has recently attempted to standardize a valid set of race codes for this project, but these are not universally used by all hospitals. Each hospital must independently map their specific codes to the state's race code categories. This mapping may not be consistent across hospitals. Thus epidemiology analysis of these two data fields does not accurately describe the true population served by the hospital.

Standard Source of Payment

The standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record.

In order to meet this requirement, each payer identification must be categorized into the appropriate standard source of payment value. With this in mind, approximately 12% of the primary payers originally categorized as "Blue Cross" were recategorized as "Managed Care", 23% "Commercial" to "Managed Care" and 3% originally categorized as "Commercial" were recategorized as "Worker's Comp". Also, approximately 2% of the secondary payers originally categorized as "Missing/Invalid" were recategorized as "Medicare", 2% that were categorized as "Other" were recategorized as "Self-Pay", 5% originally categorized as "Champus" were recategorized as "Self-Pay" and 17% originally categorized "Commercial" were recategorized as "Managed Care".

Additionally, those payers identified contractually as both "HMO and PPO" are categorized as "Commercial PPO". Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Cost/Revenue Codes

The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to managed care-negotiated discounts and denial of payment by insurance companies. Charges also do not reflect the actual cost to deliver the care that each patient needs.

Hospital Comments, 3Q2005

Certification Process

Given the current certification software, there is not an efficient mechanism to edit and correct the data. In addition, due to hospital volumes, it is not feasible to perform encounter level audits and edits. Analysis of "other physician" information should, therefore, take into consideration that a significant portion of treating physicians are excluded from the patient cases.

Diagnosis and Procedures

BIR is different from most hospitals submitting data to the state. We provide comprehensive medical rehabilitation services to patients who have lost physical or mental functioning as a result of illness or injury.

Hospital Comments, 3Q2005

Many of these patients have already received emergency care and stabilizing treatment at an acute care hospital. They are admitted to BIR to continue their recovery and focus on improving their functional ability in order to improve their quality of life to the fullest extent possible.

Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD-9-CM. This is mandated by the federal government and all hospitals must comply.

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code as many as 25 diagnoses and 25 procedures for each patient record. One limitation of using the ICD-9-CM system is that there does not exist a code for every possible diagnosis and procedure due to the continued evolution of medicine; new codes are added yearly as coding manuals are updated.

Patient diagnoses and procedures for a particular hospital stay at BIR are assigned ICD-9-CM codes according to standard coding practices. Because of our unique patient population, however, comparisons against all other hospitals in the database would not be accurate. It is unclear whether coding practice across all comprehensive medical rehabilitation facilities is consistent, so caution should be used when making comparisons and/or drawing conclusions from the data.

Length of Stay

Medical rehabilitation at BIR can be a long, arduous process depending on the severity of illness or injury. Due to the unique nature of rehabilitation services, length of stay data cannot accurately be compared with data from hospitals that primarily treat an acute or emergent episode of illness or injury.

Race/Ethnicity

There are no national standards regarding patient race categorization so hospitals may not have the same designations from which patients can choose. The state has recently attempted to standardize a valid set of race codes for this project, but these are not universally used by all hospitals. Each hospital must independently map their specific codes to the state's race code categories. This mapping may not be consistent across hospitals. Thus epidemiology analysis of these two data fields does not accurately describe the true population served by the hospital.

Standard Source of Payment

The standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record.

In order to meet this requirement, each payer identification must be categorized into the appropriate standard source of payment value. With this in mind, approximately 11% of the primary payers originally categorized as "Blue Cross" were recategorized as "Managed Care" and 21% "Commercial" to "Managed Care". Also, approximately 6% of the secondary payers originally categorized as "Blue Cross" were recategorized as "Self-Pay" and 17% that were categorized as "Missing/Invalid" were recategorized as "Managed Care."

Additionally, those payers identified contractually as both "HMO and PPO" are categorized as "Commercial PPO". Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Cost/Revenue Codes

The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to managed care-negotiated discounts and denial of payment by insurance companies.

Hospital Comments, 3Q2005

Charges also do not reflect the actual cost to deliver the care that each patient needs.

Certification Process

Given the current certification software, there is not an efficient mechanism to edit and correct the data. In addition, due to hospital volumes, it is not feasible to perform encounter level audits and edits. Within the constraints of the current THCIC process, the data is certified to the best of our knowledge

Data Content

This data is administrative data, which hospitals collect for billing purposes. Administrative data may not accurately represent the clinical details of an encounter.

The state requires us to submit inpatient claims, by quarter year, gathered from a form called an UB92, in a standard government format called HCFA 837 EDI electronic claim format. Then the state specifications require additional data elements to be included over and above that. Adding those additional data places programming burdens on the hospital since it is 'over and above' the actual hospital billing process. Errors can occur due to this additional programming, but the public should not conclude that billing data sent to our payers is inaccurate. These errors have been corrected to the best of our knowledge.

If a medical record is unavailable for coding the encounter is not billed and is not included in the data submission. This represents a rare event that is less than 1% of the encounter volume.

Diagnosis and Procedures

Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD 9 CM. This is mandated by the federal government.

The hospital complies with the guidelines for assigning these diagnosis codes, however, this is often driven by physician's subjective criteria for defining a diagnosis. For example, while one physician may diagnose a patient with anemia when the patient's blood hemoglobin level falls below 9.5, another physician may not diagnose the patient with anemia until their blood hemoglobin level is below 9.0. In both situations, a diagnosis of anemia is correctly assigned, but the criteria used by the physician to determine that diagnosis was different. An 'apples to apples' comparison cannot be made, which makes it difficult to obtain an accurate comparison of hospital or physician performance.

The codes also do not distinguish between conditions present at the time of the patient's admission to the hospital and those occurring during hospitalization. For example, if a code indicating an infection is made, it is not always possible to determine if the patient had an infection prior to admission, or developed an infection during their hospitalization.

This makes it difficult to obtain accurate information regarding things such as complication rates.

The data submitted matches the state's reporting requirements but may be incomplete due to a limitation on the number of diagnoses and procedures

Hospital Comments, 3Q2005

the state allows us to include for each patient. In other words, the state's data file may not fully represent all diagnoses treated by the hospital or all procedures performed, which can alter the true picture of a patient's hospitalization, sometimes significantly.

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code up to 99 diagnoses and 99 procedures for each patient record. The state is requiring us to submit ICD-9-CM data on each patient but has limited the number of diagnoses and procedures to the first 25 diagnoses codes and the first 25 procedure codes. As a result, the data sent by us does meet state requirements but cannot reflect all the codes an individual patient's record may have been assigned. This means also that true total volumes may not be represented by the state's data file, which therefore make percentage calculations inaccurate (i.e. mortality percentages for any given diagnosis or procedure, percentage of patients in each severity of illness category). It would be obvious; therefore, those sicker patients (more diagnoses and procedures) are less accurately reflected by the 837 format. It then stands to reason that hospitals, which treat sicker patients, are likewise less accurately reflected.

Length of Stay

The length of stay data element contained in the state's certification file is only three characters long. Thus any patients discharged with a length of stay greater than 999 days will not be accurately stored within the certification database. It is rare that patients stay longer than 999 days, therefore, it is not anticipated that this limitation will affect this data.

Admit Source data for Normal Newborn

Harris Methodist Continued Care does not have a newborn population.

Race/Ethnicity

As of the December 7, 2001, the THCIC Board indicated that they would be creating guidelines for use by hospitals. These guidelines will provide better clarity for the accurate collection of this data. Hospitals do not routinely collect race and ethnicity as part of the admission process, that this has been added to meet the THCIC requirement. Our admissions staff indicates that many patients are very sensitive about providing race and ethnicity information. Therefore, depending on the circumstances of the patient's admission, race and ethnicity data may be subjectively collected. Therefore, the race and ethnicity data may not provide an accurate representation of the patient population for a facility.

Standard/Non-Standard Source of Payment

The standard and non-standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement, each payer identifier must be categorized into the appropriate standard and non-standard source of payment value. These values might not accurately reflect the hospital payer information, because those payers identified contractually as both 'HMO, and PPO' are categorized as 'Commercial PPO'. Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Cost/ Revenue Codes

The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to managed care-negotiated discounts and denial of payment by insurance companies. Charges also do not reflect the actual cost to deliver the care that each patient needs.

This makes it difficult to obtain accurate information regarding things such as complication rates.

The data submitted matches the state's reporting requirements but may be incomplete due to a limitation on the number of diagnoses and procedures the state allows us to include for each patient. In other words, the state's data file may not fully represent all diagnoses treated by the hospital or all procedures performed, which can alter the true picture of a patient's hospitalization, sometimes significantly.

Hospital Comments, 3Q2005

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code up to 99 diagnoses and 99 procedures for each patient record. The state is requiring us to submit ICD-9-CM data on each patient but has limited the number of diagnoses and procedures to the first 25 diagnoses codes and the first 25 procedure codes. As a result, the data sent by us does meet state requirements but cannot reflect all the codes an individual patient's record may have been assigned. This means also that true total volumes may not be represented by the state's data file, which therefore make percentage calculations inaccurate (i.e. mortality percentages for any given diagnosis or procedure, percentage of patients in each severity of illness category). It would be obvious; therefore, those sicker patients (more diagnoses and procedures) are less accurately reflected by the 837 format. It then stands to reason that hospitals, which treat sicker patients, are likewise less accurately reflected.

Length of Stay

The length of stay data element contained in the state's certification file is only three characters long. Thus any patients discharged with a length of stay greater than 999 days will not be accurately stored within the certification database. It is rare that patients stay longer than 999 days, therefore, it is not anticipated that this limitation will affect this data.

Admit Source data for Normal Newborn

When the Admit type is equal to 'newborn', the admit source should indicate whether the baby was a normal newborn, premature delivery, sick baby, extramural birth, or information not available. The best way to focus on severity of illness regarding an infant would be to check the infant's diagnosis at discharge, not the admitting source code. Many hospital information systems and registration process defaults to 'normal delivery' as the admission source. Therefore, admission source does not always give an accurate picture.

If admission source is used to examine length of stay or mortality for normal neonates using the admit source to identify the cases, the data will reflect premature and sick babies mixed in with the normal newborn data. Presbyterian Hospital of Plano recommends use of ICD9 coding data to identify neonates. This methodology will ensure correct identification of the clinical status of the newborn admission.

Race/Ethnicity

As of the December 7, 2001, the THCIC Board indicated that they would be creating guidelines for use by hospitals. These guidelines will provide better clarity for the accurate collection of this data. Hospitals do not routinely collect race and ethnicity as part of the admission process, that this has been added to meet the THCIC requirement. Our admissions staff indicates that many patients are very sensitive about providing race and ethnicity information. Therefore, depending on the circumstances of the patient's admission, race and ethnicity data may be subjectively collected. Therefore, the race and ethnicity data may not provide an accurate representation of the patient population for a facility.

Standard/Non-Standard Source of Payment

The standard and non-standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement, each payer identifier must be categorized into the appropriate standard and non-standard source of payment value. These values might not accurately reflect the hospital payer information, because those payers identified contractually as both 'HMO, and PPO' are categorized as 'Commercial PPO'. Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate

analysis.

THCIC ID: 679000
QUARTER: 3
YEAR: 2005

Certified with comments

Data Source - The data included in this file is administrative, not clinical research data. Administrative data may not accurately represent the clinical details of a patient visit. This data should be cautiously used to evaluate health care quality and compare outcomes.

Charity Care - This data does not accurately reflect the number of charity cases for the time period. Charity and self-pay patients are difficult to assign in the data submitted to the state. We are not able to classify a patient account as "charity" until after discharge when other potential payment sources have been exhausted. Because of this, charity care is combined with the Self Pay category. The amount of charges forgone for Burleson St. Joseph Health Center charity care, based on established rates for the first three quarters of 2005 was \$ 451,774.

Patient Mix - All statistics for Burleson St. Joseph Health Center include patients from our Skilled Nursing, and Acute Care populations. Our Skilled Nursing unit is a long-term care unit. Because of this Mortality and Length of Stay may be skewed. This will prohibit any meaningful comparisons between Burleson St. Joseph Health Center and any "acute care only" facilities.

Physicians - All physician license numbers and names have been validated as accurate but some remain unidentified in the THCIC Practitioner Reference

Hospital Comments, 3Q2005

Files. Mortalities reported may be related to physicians other than the attending Physician. The attending physician is charged with the procedures requested or performed by the consulting or specialist physicians.

Diagnosis and Procedures - Data submitted to the state may be incomplete for some patients due to the limitation on the number of diagnosis and procedures codes allowed. The data is limited to nine diagnoses codes and six procedure codes per patient visit.

Cost and Charges - The state requires that we submit revenue information including charges. It is important to note that charges do not reflect actual reimbursement received, nor do they reflect the actual cost of providing the services. Typically actual payments received are much less than the charges due to managed care-negotiated discounts, denial of payment by insurance companies, contractual allowances, as well as charity and un-collectable accounts. The relationship between cost of care, charges, and the revenue a facility receives is extremely complex. Comparing costs of care from one hospital to the next may result in unreliable results.

Severity Adjustment - THCIC is using the 3M APR-DRG grouper to assign the APR-DRG (All-Patient Refined Diagnoses Related Grouping) severity and risk of mortality scores. The assignment is made by evaluation of the patient's age, sex, diagnosis codes, procedure codes, and discharge status. This grouper can only use the limited number of procedure and diagnosis codes available in the data file (nine diagnosis and six procedure codes). If all the patient's diagnosis codes were available the APR-DRG assignment may possibly differ from the APR-DRG assigned by THCIC. The severity grouping assignment performed by the state using the APR-DRG grouper cannot be replicated by facilities unless they purchase this grouper.

Additionally, the lack of education regarding how this grouper calculates the severity adjustments or how it functions can greatly impact the interpretation of the data.

Data Source. The source of this data, the electronic 1450, is administrative in nature, and was collected for billing purposes. It is not clinical data and should be cautiously used to evaluate health care quality.

* The Hospital can only list 4 physicians that were involved with any one patient. Other physicians who were involved in those cases will not be identified.

Payer Codes. The payer codes utilized in the THCIC data base were defined by the state. They are not utilizing the standard payer information from the claim.

Revenue Codes and Charges. Charges associated with the 1450 data do not represent actual payments or costs for services.

Severity Adjustment. THCIC is using the 3M APR-DRG system to assign the All-Patient Refined (APR) DRG, severity and risk of mortality scores.

The scores represent a categorization of patient severity and mortality risk. The assignment is made by evaluation of the patient's age, sex, diagnosis codes, procedure codes, and discharge status.

* The program can only use the codes available in the 1450 data file, e.g., nine diagnosis and six procedure codes. If all the patient's diagnosis codes were available the assignment may be different than when limited to those available in the 1450 data.

Timing of Data Collection. Hospitals must submit data to THCIC no later than 60 days after the close of the quarter.

* Not all claims may have been billed at this time.

* Internal data may be updated later and appear different than the data on the claim. Unless the payment is impacted, the hospital does not rebill when a data field is changed internally. This results in differences between internal systems and the snapshot of data that was taken at the end of the quarter.

PROVIDER: Our Childrens House Baylor
THCIC ID: 710000
QUARTER: 3
YEAR: 2005

Certified with comments

Submission Timing

Our Children's House at Baylor (OCH) estimates that our data volumes for the calendar year time period submitted may include 96% to 100% of all cases for that time period. The state requires us to submit a snapshot of billed claims, extracted from our database approximately 20 days following the close of the calendar year quarter. Any discharged patient encounters not billed by this cut-off date will not be included in the quarterly submission file sent in.

Physician Identification

All physician license numbers and names have been validated as accurate against a physician reference file that is derived from information provided by the Texas Board of Medical Examiners. Those physicians not yet assigned a state license number at the time of data submission are given temporary numbers by the hospital for state reporting purposes. Due to the "lag" time between when the physician is licensed and when THCIC receives the information, some physicians may remain unidentified in the THCIC Practitioner Reference Files.

The THCIC minimum data set houses only two (2) physician fields; Attending Physician and Operating or Other Physician (if applicable) as reflected on the UB92 billing document. Mortality rates, case costs and other data calculated for this population of physicians may be misrepresentative. Due to the complexity of most inpatient admissions many physicians provide

Hospital Comments, 3Q2005

care to patients throughout an admission. Consulting physicians may prescribe and treat patients on behalf of the physician listed as the attending physician. Analysis of this physician information should carefully consider that significant variations in case count, case cost, and mortality may not be directly related to the care provided by the attending physician, but also reflect the varied use of consultants.

While hospitals document many treating physicians (surgeons and consultants) for each case, THCIC maintains only one (1) additional physician per case besides the Attending. "Other" physician case volumes, mortality, case costs and LOS, will frequently be inaccurate because of this limitation. Surgeons and consulting physicians beyond one that may have been involved on a case will not be credited with providing care for that patient. Analysis of "other physician" information should, therefore, take into consideration that a significant portion of treating physicians are excluded from the patient cases.

Diagnosis and Procedures

OCH is different from most hospitals submitting data to the state. We provide complex medical services to patients who have experienced a catastrophic illness, congenital anomalies and/or complex body system failure that requires coordinated, intensive treatment and care. Many of the patients have received emergency care and stabilizing treatment at another acute care hospital or another children's acute care hospital. They are admitted to OCH to continue their recovery and focus on improving their medical condition.

Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD-9-CM. This is mandated by the federal government and all hospitals must comply.

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code as many as 25 diagnoses and 25 procedures for each patient record. One limitation of using the ICD-9-CM system is that there does not exist a code for every possible diagnosis and procedure due to the continued evolution of medicine; new codes are added yearly as coding manuals are updated.

Patient diagnoses and procedures for a particular hospital stay at OCH are assigned ICD-9-CM codes according to standard coding practices. Because of our unique patient population, however, comparisons against all other hospitals in the database would not be accurate. It is unclear whether coding practice across all Children's hospitals is consistent, so caution should be used when making comparisons and/or drawing conclusions from the data.

Length of Stay

Medical recovery at OCH can be a long, arduous process depending on the severity of illness or injury. Due to the unique nature of medically complex patients, length of stay data cannot accurately be compared with data from hospitals that primarily treat an acute or emergent episode of illness or injury.

Admission Source

The majority of entries for "Admission Source" were coded incorrectly (erroneously reflecting that our main source of admission was "Physician Referral"). The majority of admission sources are "Transfer from Hospital". This was due to a procedural error which has now been corrected.

Race/Ethnicity

There are no national standards regarding patient race categorization so hospitals may not have the same designations from which patients can

Hospital Comments, 3Q2005

choose. The state has recently attempted to standardize a valid set of race codes for this project but these are not universally used by all hospitals. Each hospital must independently map their specific codes to the state's race code categories. This mapping may not be consistent across hospitals. Thus epidemiology analysis of these two data fields does not accurately describe the true population served by the hospital.

"Asian or Pacific Islander" encounters are not broken out separately but are included in the "Other" race category.

Standard Source of Payment

The standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record.

In order to meet this requirement each payer identification must be categorized into the appropriate standard and non-standard source of payment value.

It should also be noted that the primary payer associated to the patient's encounter record might change over time. Upon review, approximately 9% of the primary payers originally categorized as "Blue Cross" and 46% categorized as "Commercial" were recategorized as "Managed Care". Also, 7% of secondary payors categorized as "Missing/Invalid" were recategorized as "Medicaid" and 3% categorized as "Commercial" were recategorized as "Managed Care".

Additionally, those payers identified contractually as both "HMO and PPO" are categorized as "Commercial PPO". Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Cost/ Revenue Codes

The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to managed care-negotiated discounts and denial of payment by insurance companies. Charges also do not reflect the actual cost to deliver the care that each patient needs.

Certification Process

Given the current certification software, there is not an efficient mechanism to edit and correct the data. In addition, due to hospital volumes, it is not feasible to perform encounter level audits and edits. Within the constraints of the current THCIC process, the data is certified to the best of our knowledge as accurate and complete given the above comments.

Data Content

This data is administrative data, which hospitals collect for billing purposes. Administrative data may not accurately represent the clinical details of an encounter.

The state requires us to submit inpatient claims, by quarter year, gathered from a form called an UB92, in a standard government format called HCFA 837 EDI electronic claim format. Then the state specifications require additional data elements to be included over and above that. Adding those additional data places programming burdens on the hospital since it is 'over and above' the actual hospital billing process. Errors can occur due to this additional programming, but the public should not conclude that billing data sent to our payers is inaccurate. These errors have been corrected to the best of our knowledge.

If a medical record is unavailable for coding the encounter is not billed and is not included in the data submission. This represents a rare event that is less than 1% of the encounter volume.

Diagnosis and Procedures

Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD 9 CM. This is mandated by the federal government.

The hospital complies with the guidelines for assigning these diagnosis codes, however, this is often driven by physician's subjective criteria for defining a diagnosis. For example, while one physician may diagnose a patient with anemia when the patient's blood hemoglobin level falls below 9.5, another physician may not diagnose the patient with anemia until their blood hemoglobin level is below 9.0. In both situations, a diagnosis of anemia is correctly assigned, but the criteria used by the physician to determine that diagnosis was different. An 'apples to apples' comparison cannot be made, which makes it difficult to obtain an accurate comparison of hospital or physician performance.

The codes also do not distinguish between conditions present at the time of the patient's admission to the hospital and those occurring during hospitalization. For example, if a code indicating an infection is made, it is not always possible to determine if the patient had an infection prior to admission, or developed an infection during their hospitalization.

This makes it difficult to obtain accurate information regarding things such as complication rates.

The data submitted matches the state's reporting requirements but may be incomplete due to a limitation on the number of diagnoses and procedures the state allows us to include for each patient. In other words, the state's data file may not fully represent all diagnoses treated by the hospital or all procedures performed, which can alter the true picture of a patient's hospitalization, sometimes significantly.

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code up to 99 diagnoses and 99 procedures for each patient record. The state is requiring us to submit ICD-9-CM data on each patient but has limited the number of diagnoses and procedures to the first 25 diagnoses codes

Hospital Comments, 3Q2005

and the first 25 procedure codes. As a result, the data sent by us does meet state requirements but cannot reflect all the codes an individual patient's record may have been assigned. This means also that true total volumes may not be represented by the state's data file, which therefore make percentage calculations inaccurate (i.e. mortality percentages for any given diagnosis or procedure, percentage of patients in each severity of illness category). It would be obvious; therefore, those sicker patients (more diagnoses and procedures) are less accurately reflected by the 837 format. It then stands to reason that hospitals, which treat sicker patients, are likewise less accurately reflected.

Length of Stay

The length of stay data element contained in the state's certification file is only three characters long. Thus any patients discharged with a length of stay greater than 999 days will not be accurately stored within the certification database. It is rare that patients stay longer than 999 days, therefore, it is not anticipated that this limitation will affect this data.

Admit Source data for Normal Newborn

When the Admit type is equal to 'newborn', the admit source should indicate whether the baby was a normal newborn, premature delivery, sick baby, extramural birth, or information not available. The best way to focus on severity of illness regarding an infant would be to check the infant's diagnosis at discharge, not the admitting source code. Many hospital information systems and registration process defaults to 'normal delivery' as the admission source. Therefore, admission source does not always give an accurate picture.

If admission source is used to examine length of stay or mortality for normal neonates using the admit source to identify the cases, the data will reflect premature and sick babies mixed in with the normal newborn data. Seay Behavioral Center recommends use of ICD9 coding data to identify neonates. This methodology will ensure correct identification of the clinical status of the newborn admission.

Race/Ethnicity

As of the December 7, 2001, the THCIC Board indicated that they would be creating guidelines for use by hospitals. These guidelines will provide better clarity for the accurate collection of this data. Hospitals do not routinely collect race and ethnicity as part of the admission process, that this has been added to meet the THCIC requirement. Our admissions staff indicates that many patients are very sensitive about providing race and ethnicity information. Therefore, depending on the circumstances of the patient's admission, race and ethnicity data may be subjectively collected. Therefore, the race and ethnicity data may not provide an accurate representation of the patient population for a facility.

Standard/Non-Standard Source of Payment

The standard and non-standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement, each payer identifier must be categorized into the appropriate standard and non-standard source of payment value. These values might not accurately reflect the hospital payer information, because those payers identified contractually as both 'HMO, and PPO' are categorized as 'Commercial PPO'. Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Cost/ Revenue Codes

The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the

Hospital Comments, 3Q2005

service. Typically actual payments are much less than charges due to managed care-negotiated discounts and denial of payment by insurance companies. Charges also do not reflect the actual cost to deliver the care that each patient needs.

Discharge Disposition

THR has identified a problem with a vendor (Seimens) extract that diverts some patient discharges to "home" as opposed to rehab. THR will communicate this issue and the plan to address this issue in writing to the THCIC Executive Director.

Data Content

This data is administrative data, which hospitals collect for billing purposes. Administrative data may not accurately represent the clinical details of an encounter.

The state requires us to submit inpatient claims, by quarter year, gathered from a form called an UB92, in a standard government format called HCFA 837 EDI electronic claim format. Then the state specifications require additional data elements to be included over and above that. Adding those additional data places programming burdens on the hospital since it is 'over and above' the actual hospital billing process. Errors can occur due to this additional programming, but the public should not conclude that billing data sent to our payers is inaccurate. These errors have been corrected to the best of our knowledge.

If a medical record is unavailable for coding the encounter is not billed and is not included in the data submission. This represents a rare event that is less than 1% of the encounter volume.

Diagnosis and Procedures

Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD 9 CM. This is mandated by the federal government.

The hospital complies with the guidelines for assigning these diagnosis codes, however, this is often driven by physician's subjective criteria for defining a diagnosis. For example, while one physician may diagnose a patient with anemia when the patient's blood hemoglobin level falls below 9.5, another physician may not diagnose the patient with anemia until their blood hemoglobin level is below 9.0. In both situations, a diagnosis of anemia is correctly assigned, but the criteria used by the physician to determine that diagnosis was different. An 'apples to apples' comparison cannot be made, which makes it difficult to obtain an accurate comparison of hospital or physician performance.

The codes also do not distinguish between conditions present at the time of the patient's admission to the hospital and those occurring during hospitalization. For example, if a code indicating an infection is made, it is not always possible to determine if the patient had an infection prior to admission, or developed an infection during their hospitalization.

This makes it difficult to obtain accurate information regarding things such as complication rates.

The data submitted matches the state's reporting requirements but may be incomplete due to a limitation on the number of diagnoses and procedures

Hospital Comments, 3Q2005

the state allows us to include for each patient. In other words, the state's data file may not fully represent all diagnoses treated by the hospital or all procedures performed, which can alter the true picture of a patient's hospitalization, sometimes significantly.

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code up to 99 diagnoses and 99 procedures for each patient record. The state is requiring us to submit ICD-9-CM data on each patient but has limited the number of diagnoses and procedures to the first 25 diagnoses codes and the first 25 procedure codes. As a result, the data sent by us does meet state requirements but cannot reflect all the codes an individual patient's record may have been assigned. This means also that true total volumes may not be represented by the state's data file, which therefore make percentage calculations inaccurate (i.e. mortality percentages for any given diagnosis or procedure, percentage of patients in each severity of illness category). It would be obvious; therefore, those sicker patients (more diagnoses and procedures) are less accurately reflected by the 837 format. It then stands to reason that hospitals, which treat sicker patients, are likewise less accurately reflected.

Length of Stay

The length of stay data element contained in the state's certification file is only three characters long. Thus any patients discharged with a length of stay greater than 999 days will not be accurately stored within the certification database. It is rare that patients stay longer than 999 days, therefore, it is not anticipated that this limitation will affect this data.

Admit Source data for Normal Newborn

When the Admit type is equal to 'newborn', the admit source should indicate whether the baby was a normal newborn, premature delivery, sick baby, extramural birth, or information not available. The best way to focus on severity of illness regarding an infant would be to check the infant's diagnosis at discharge, not the admitting source code. Many hospital information systems and registration process defaults to 'normal delivery' as the admission source. Therefore, admission source does not always give an accurate picture.

If admission source is used to examine length of stay or mortality for normal neonates using the admit source to identify the cases, the data will reflect premature and sick babies mixed in with the normal newborn data. Presbyterian Hospital of Allen recommends use of ICD9 coding data to identify neonates. This methodology will ensure correct identification of the clinical status of the newborn admission.

Race/Ethnicity

As of the December 7, 2001, the THCIC Board indicated that they would be creating guidelines for use by hospitals. These guidelines will provide better clarity for the accurate collection of this data. Hospitals do not routinely collect race and ethnicity as part of the admission process, that this has been added to meet the THCIC requirement. Our admissions staff indicates that many patients are very sensitive about providing race and ethnicity information. Therefore, depending on the circumstances of the patient's admission, race and ethnicity data may be subjectively collected. Therefore, the race and ethnicity data may not provide an accurate representation of the patient population for a facility.

Standard/Non-Standard Source of Payment

The standard and non-standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement, each payer identifier must be categorized into the appropriate standard and non-standard source

Hospital Comments, 3Q2005

of payment value. These values might not accurately reflect the hospital payer information, because those payers identified contractually as both 'HMO, and PPO' are categorized as 'Commercial PPO'. Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Cost/ Revenue Codes

The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to managed care-negotiated discounts and denial of payment by insurance companies. Charges also do not reflect the actual cost to deliver the care that each patient needs.

Discharge Disposition

THR has identified a problem with a vendor (Seimens) extract that diverts some patient discharges to "home" as opposed to rehab. THR will communicate this issue and the plan to address this issue in writing to the THCIC Executive Director.

PROVIDER: Grimes St Joseph Health Center
THCIC ID: 728800
QUARTER: 3
YEAR: 2005

Certified with comments

Data Source - The data included in this file is administrative, not clinical research data. Administrative data may not accurately represent the clinical details of a patient visit. This data should be cautiously used to evaluate health care quality and compare outcomes.

Charity Care - This data does not accurately reflect the number of charity cases for the time period. Charity and self-pay patients are difficult to assign in the data submitted to the state. We are not able to classify a patient account as "charity" until after discharge when other potential payment sources have been exhausted. Because of this, charity care is combined with the Self Pay category. The amount of charges forgone for Grimes St. Joseph Health Center charity care, based on established rates for the first three quarters of 2005 was \$277,686.

Patient Mix - Grimes St. Joseph Health Center is a "Critical Access Hospital". Because of this Mortality and Length of Stay may be skewed. This will prohibit any meaningful comparisons between Grimes St. Joseph Health Center and any "acute care only" facilities.

Physicians - All physician license numbers and names have been validated as accurate but some remain unidentified in the THCIC Practitioner Reference Files. Mortalities reported may be related to physicians other than the attending Physician. The attending physician is charged with the procedures requested or performed by the consulting or specialist physicians.

Diagnosis and Procedures - Data submitted to the state may be incomplete for some patients due to the limitation on the number of diagnosis and procedures codes allowed. The data is limited to nine diagnoses codes and six procedure codes per patient visit.

Cost and Charges - The state requires that we submit revenue information including charges. It is important to note that charges do not reflect actual reimbursement received, nor do they reflect the actual cost of providing the services. Typically actual payments received are much less than the charges due to managed care-negotiated discounts, denial of payment

Hospital Comments, 3Q2005

by insurance companies, contractual allowances, as well as charity and un-collectable accounts. The relationship between cost of care, charges, and the revenue a facility receives is extremely complex. Comparing costs of care from one hospital to the next may result in unreliable results.

Severity Adjustment - THCIC is using the 3M APR-DRG grouper to assign the APR-DRG (All-Patient Refined Diagnoses Related Grouping) severity and risk of mortality scores. The assignment is made by evaluation of the patient's age, sex, diagnosis codes, procedure codes, and discharge status. This grouper can only use the limited number of procedure and diagnosis codes available in the data file (nine diagnosis and six procedure codes). If all the patient's diagnosis codes were available the APR-DRG assignment may possibly differ from the APR-DRG assigned by THCIC. The severity grouping assignment performed by the state using the APR-DRG grouper cannot be replicated by facilities unless they purchase this grouper.

Additionally, the lack of education regarding how this grouper calculates the severity adjustments or how it functions can greatly impact the interpretation of the data.

Data Content

This data is administrative data, which hospitals collect for billing purposes. Administrative data may not accurately represent the clinical details of an encounter.

The state requires us to submit inpatient claims, by quarter year, gathered from a form called an UB92, in a standard government format called HCFA 837 EDI electronic claim format. Then the state specifications require additional data elements to be included over and above that. Adding those additional data places programming burdens on the hospital since it is 'over and above' the actual hospital billing process. Errors can occur due to this additional programming, but the public should not conclude that billing data sent to our payers is inaccurate. These errors have been corrected to the best of our knowledge.

If a medical record is unavailable for coding the encounter is not billed and is not included in the data submission. This represents a rare event that is less than 1% of the encounter volume.

Diagnosis and Procedures

Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD 9 CM. This is mandated by the federal government.

The hospital complies with the guidelines for assigning these diagnosis codes, however, this is often driven by physician's subjective criteria for defining a diagnosis. For example, while one physician may diagnose

Hospital Comments, 3Q2005

a patient with anemia when the patient's blood hemoglobin level falls below 9.5, another physician may not diagnose the patient with anemia until their blood hemoglobin level is below 9.0. In both situations, a diagnosis of anemia is correctly assigned, but the criteria used by the physician to determine that diagnosis was different. An 'apples to apples' comparison cannot be made, which makes it difficult to obtain an accurate comparison of hospital or physician performance.

The codes also do not distinguish between conditions present at the time of the patient's admission to the hospital and those occurring during hospitalization. For example, if a code indicating an infection is made, it is not always possible to determine if the patient had an infection prior to admission, or developed an infection during their hospitalization.

This makes it difficult to obtain accurate information regarding things such as complication rates.

The data submitted matches the state's reporting requirements but may be incomplete due to a limitation on the number of diagnoses and procedures the state allows us to include for each patient. In other words, the state's data file may not fully represent all diagnoses treated by the hospital or all procedures performed, which can alter the true picture of a patient's hospitalization, sometimes significantly.

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code up to 99 diagnoses and 99 procedures for each patient record. The state is requiring us to submit ICD-9-CM data on each patient but has limited the number of diagnoses and procedures to the first 25 diagnoses codes and the first 25 procedure codes. As a result, the data sent by us does meet state requirements but cannot reflect all the codes an individual patient's record may have been assigned. This means also that true total volumes may not be represented by the state's data file, which therefore make percentage calculations inaccurate (i.e. mortality percentages for any given diagnosis or procedure, percentage of patients in each severity of illness category). It would be obvious; therefore, those sicker patients (more diagnoses and procedures) are less accurately reflected by the 837 format. It then stands to reason that hospitals, which treat sicker patients, are likewise less accurately reflected.

Length of Stay

The length of stay data element contained in the state's certification file is only three characters long. Thus any patients discharged with a length of stay greater than 999 days will not be accurately stored within the certification database. It is rare that patients stay longer than 999 days, therefore, it is not anticipated that this limitation will affect this data.

Admit Source data for Normal Newborn

When the Admit type is equal to 'newborn', the admit source should indicate whether the baby was a normal newborn, premature delivery, sick baby, extramural birth, or information not available. The best way to focus on severity of illness regarding an infant would be to check the infant's diagnosis at discharge, not the admitting source code. Many hospital information systems and registration process defaults to 'normal delivery' as the admission source. Therefore, admission source does not always give an accurate picture.

If admission source is used to examine length of stay or mortality for normal neonates using the admit source to identify the cases, the data will reflect premature and sick babies mixed in with the normal newborn data. Harris Methodist Springwood recommends use of ICD9 coding data to identify neonates. This methodology will ensure correct identification

of the clinical status of the newborn admission.

Race/Ethnicity

As of the December 7, 2001, the THCIC Board indicated that they would be creating guidelines for use by hospitals. These guidelines will provide better clarity for the accurate collection of this data. Hospitals do not routinely collect race and ethnicity as part of the admission process, that this has been added to meet the THCIC requirement. Our admissions staff indicates that many patients are very sensitive about providing race and ethnicity information. Therefore, depending on the circumstances of the patient's admission, race and ethnicity data may be subjectively collected. Therefore, the race and ethnicity data may not provide an accurate representation of the patient population for a facility.

Standard/Non-Standard Source of Payment

The standard and non-standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement, each payer identifier must be categorized into the appropriate standard and non-standard source of payment value. These values might not accurately reflect the hospital payer information, because those payers identified contractually as both 'HMO, and PPO' are categorized as 'Commercial PPO'. Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Cost/ Revenue Codes

The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to managed care-negotiated discounts and denial of payment by insurance companies. Charges also do not reflect the actual cost to deliver the care that each patient needs.

Discharge Disposition

THR has identified a problem with a vendor (Seimens) extract that diverts some patient discharges to "home" as opposed to rehab. THR will communicate this issue and the plan to address this issue in writing to the THCIC Executive Director.

=====

PROVIDER: Baylor Heart & Vascular Center
THCIC ID: 784400
QUARTER: 3
YEAR: 2005

Certified with comments

Submission Timing

Baylor estimates that our data volumes for the calendar year time period submitted may include 96% to 100% of all cases for that time period. The state requires us to submit a snapshot of billed claims, extracted from our database approximately 20 days following the close of the calendar year quarter. Any discharged patient encounters not billed by this cut-off date will not be included in the quarterly submission file sent in.

Physician Identification

All physician license numbers and names have been validated as accurate against a physician reference file that is derived from information provided by the Texas Board of Medical Examiners. Those physicians not yet assigned a state license number at the time of data submission are given temporary numbers by the hospital for state reporting purposes. Due to the "lag" time between when the physician is licensed and when THCIC receives the information, some physicians may remain unidentified in the THCIC Practitioner

Reference Files.

The THCIC minimum data set houses only two (2) physician fields; Attending Physician and Operating or Other Physician (if applicable) as reflected on the UB92 billing document. Mortality rates, case costs and other data calculated for this population of physicians may be misrepresentative. Due to the complexity of most inpatient admissions many physicians provide care to patients throughout an admission. Consulting physicians may prescribe and treat patients on behalf of the physician listed as the attending physician. Analysis of this physician information should carefully consider that significant variations in case count, case cost, and mortality may not be directly related to the care provided by the attending physician, but also reflect the varied use of consultants.

While hospitals document many treating physicians (surgeons and consultants) for each case, THCIC maintains only one (1) additional physician per case besides the Attending. "Other" physician case volumes, mortality, case costs and LOS, will frequently be inaccurate because of this limitation. Surgeons and consulting physicians beyond one that may have been involved on a case will not be credited with providing care for that patient. Analysis of "other physician" information should, therefore, take into consideration that a significant portion of treating physicians are excluded from the patient cases.

Diagnosis and Procedures

Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD-9-CM. This is mandated by the federal government and all hospitals must comply.

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code as many as 25 diagnoses and 25 procedures for each patient record. One limitation of using the ICD-9-CM system is that there does not exist a code for every possible diagnosis and procedure due to the continued evolution of medicine; new codes are added yearly as coding manuals are updated.

Race/Ethnicity

There are no national standards regarding patient race categorization so hospitals may not have the same designations from which patients can choose. The state has recently attempted to standardize a valid set of race codes for this project but these are not universally used by all hospitals. Each hospital must independently map their specific codes to the state's race code categories. This mapping may not be consistent across hospitals. Thus epidemiology analysis of these two data fields does not accurately describe the true population served by the hospital.

Standard Source of Payment

The standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record.

In order to meet this requirement each payer identification must be categorized into the appropriate standard source of payment value. It should also be noted that the primary payer associated to the patient's encounter record might change over time. Upon review approximately 12% of the primary payers originally categorized as "Blue Cross" were recategorized as "Managed Care", 27% categorized as "Commercial" were recategorized as "Managed Care" and 3% originally categorized as "Commercial" were recategorized as "Medicare". Also approximately 9% of the secondary payers originally categorized as "Blue Cross" were recategorized as "Managed Care", 12% categorized as "Commercial" recategorized as "Missing/Invalid" and 3% originally categorized as "Commercial" were recategorized as "Campus".

Additionally, those payers identified contractually as both "HMO, and

Hospital Comments, 3Q2005

PP0" are categorized as "Commercial PP0". Thus any true managed care comparisons by contract type (HMO vs. PP0) may result in inaccurate analysis.

Cost/ Revenue Codes

The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to managed care-negotiated discounts and denial of payment by insurance companies. Charges also do not reflect the actual cost to deliver the care that each patient needs.

Certification Process

Given the current certification software, there is not an efficient mechanism to edit and correct the data. In addition, due to hospital volumes, it is not feasible to perform encounter level audits and edits. Within the constraints of the current THCIC process, the data is certified to the best of our knowledge as accurate and complete given the above comments.

=====

PROVIDER: Baylor Medical Center at Frisco
THCIC ID: 787400
QUARTER: 3
YEAR: 2005

Certified with comments:

The Texas Health Care Information Council (THCIC) has been charged with collecting data on each inpatient discharge. The state of Texas has given hospitals the responsibility of reporting this data in a timely manner expecting accuracy of information using billing information which could use to compare clinical outcomes. Baylor Medical Center at Frisco would like the following comments submitted with their 2005 third quarter data.

Data Content:

Due to system limitations, note, that this is just an estimate and relates to identified sources of funds, rather than actual collections from identified sources. This data is administrative data, which hospitals collect for billing and reimbursement purposes, and not clinical data in the medical records from which judgments concerning medical care can be made. The state requires us to submit inpatient claims by quarter end; our data is gathered using the hospital's Meditech system and downloaded to a 1450 file flat file. This file is submitted to Solucient by an electronic transfer via a web browser. This information is submitted to Solucient's secure site where it is formatted to an 837 file as required by the state of Texas THCIC. Before submitting the data to the Texas Health Care Information Council (THCIC), it is reviewed by data quality checks and verified for content using the error threshold established by the Texas Hospital Association.

Submission Timing:

The hospital estimates that our data volumes for the calendar year time period submitted may be less than the total % of all cases for that period. The state requires us to submit a snapshot of billed claims, extracted from our discharge database following the close of the calendar year quarter. Any discharged patient encounter not billed by the cut off date will not be included in the quarterly submission file. Baylor Medical Center at Frisco has submitted its third quarter data for the year 2005. We had approximately 181 inpatient discharges during this quarter, of which 163 claims were submitted. This gives Baylor Medical Center at Frisco a 90% submittal rate.

Cost and Charges:

The state requires that the hospital submit revenue information including charges. It is important to note that charges do not reflect the actual cost of providing the

Hospital Comments, 3Q2005

service, and typically actual payments received are much less than the charges due to managed care contracts, negotiated discounts, and even denial of claims by insurance companies. The hospital has also done charity work as well as un-collectable accounts, which were not included in the data. Baylor Medical Center at Frisco supports its community in several areas not included in this data.

Physicians:

All physicians on staff at Baylor Medical Center at Frisco go thru the credentialing process where their license number and names are validated as accurate. The THCIC practitioner reference files are not updated timely enough to capture all the new physicians. As a result of this, some of our physicians are unidentified in the data, or consulting physicians may be credited with assisting in these procedures. THCIC has provided a UPIN lookup for physician identification numbers which has been helpful in correcting this problem. Some physician data is not submitted or unavailable because their UPIN number did not match the state database. Unfortunately the THCIC software did not allow changes to the fields, so this data was not submitted. There are also discrepancies in the spelling of physician's names in the Attending Physician report and Operating Practitioner Report due to clerical errors, when typing in the data in the Key Claim software. This process has been improved, by electronically submitting our data from the hospital's billing system.

Diagnosis and Procedures:

The data submitted matches the states reporting requirements but may be incomplete due to limitations of software compatibilities between 3M Coding software and Meditech the hospital's information system. We have made great improvements in our data capturing by utilizing electronic submission. The data submitted might not fully represent all diagnosis or procedures performed at our facility, which could alter the true picture of a patient's hospitalization. Baylor Medical Center at Frisco utilizes the 3M Coding Software to assign a universal standard set of codes recognized by the World Health Organization called the ICD-9CM or International Classification of Disease Index. We receive quarterly updates of new codes, reference material and HCFA regulation changes. We also utilize Precyse Solutions a Health Information Services firm to verify the accuracy of our coding, which has consistently fallen within the 95 to 100% accuracy rating.

Race and Ethnicity:

The hospital admission staff is responsible for capturing demographic data on all our patients during the registration process. Race and ethnicity are sensitive topics; we utilize discretion when gathering this information from the patient's in the registration area. To assist in gathering this data we have included an ethnicity question in our registration procedure, we believe our data has improved as a result of this effort.

William Keaton CEO

PROVIDER: Dubois Hospital -Paris

THCIC ID: 787500

QUARTER: 3

YEAR: 2005

Certified with comments

Dubois Hospital is a Long Term Acute Care Hospital. This designation of Long Term Acute separates Dubois Hospital from Short Term Acute Hospitals in many aspects. Therefore relevant comparisons should be made with only other Long Term Acute Hospitals.

Only acutely ill patients requiring an average length of stay of approximately 25 days are admitted to Dubois Hospital per our designation as Long Term Acute. Therefore our length of stay is much longer than a regular Short Term Hospital.

Hospital Comments, 3Q2005

In addition, our patient mix is predominately elderly as they most often have more serious illnesses with more frequent secondary problems. Subsequently they require a longer hospital stay than the younger population.

Elect not to certify

I elect not to certify 3rd quarter 2005 data for Texas Orthopedic Hospital due to the fact Texas Orthopedic Hospital is licensed as a 49 bed acute care hospital which operates as an ambulatory specialty orthopedic facility. Approximately 80% of all surgical procedures are performed on an outpatient basis. Because of the specialty nature and the high percentage of outpatient surgeries, Texas Orthopedic Hospital has a uniqueness that would limit the general population's ability to form an accurate opinion or decision on the quality of services provided.

The data enclosed does not reflect the actual practice of the individual surgeons and the care given to the inpatient population. Texas Orthopedic Hospital, as a top 100 orthopedic hospital ranked by HCIA, is a referral center and the individual physicians accept referrals from other physicians for patient's that may have had a malfunction of an internal orthopedic device or an infection, which needs to be surgically corrected. It is imperative that individuals looking at the data be aware of these facts

Hospital Comments, 3Q2005

so that frequently listed diagnoses of 996.4 and/or 996.66 be interpreted as a result of the patient's primary surgery, as performed by the treating physician. These may well be referred cases for which the original treating physician is not comfortable correcting through surgical means. They do not reflect the practice of the individual Texas Orthopedic Hospital surgeon, i.e., complication of his work. Therefore, the data presented by THCIC to the public could be misinterpreted and not truly reflect the high quality outcomes and superb care our patients receive.

PROVIDER: St Lukes Community Medical Center-The Woodlands
THCIC ID: 793100
QUARTER: 3
YEAR: 2005

Certified with comments

The data reports for Quarter 3, 2005 do not accurately reflect patient volume or severity.

Patient Volume

Data reflects administrative claims data (Uniform Billing data elements) that are a snapshot of claims one month following quarter-end. If the encounter has not yet been billed, data will not be reflected in this quarter.

Severity

Descriptors for newborn admissions are based on national billing data elements (UB92) and definitions of each element can and do vary from hospital to hospital. Because of the absence of universal definitions for normal delivery, premature delivery and sick baby, this category cannot be used for comparison across hospitals. The DRG is the only somewhat meaningful description of the infant population born at a facility.

More importantly, not all clinically significant conditions, such as the heart's ejection fraction, can be captured and reflected in the various billing data elements including the ICD-9-CM diagnosis coding system.

As a result, the true clinical picture of the patient population cannot be adequately demonstrated using admissions and billing data.

Claim Filing Indicator

Due to a format change made by THCIC after the submission of the data, the Claim Filing Indicator Codes (Payer designations) reflect the old format and not the new one.

THCIC ID: 797001

Hospital Comments, 3Q2005

QUARTER: 3
YEAR: 2005

Certified with comments

Dubuis Hospital is a Long Term Acute Care Hospital. This designation of Long Term Acute separates Dubuis Hospital from Short Term Acute Hospitals in many aspects. Therefore relevant comparisons should be made with only other Long Term Acute Hospitals.

Only acutely ill patients requiring an average length of stay of approximately 25 days are admitted to Dubuis Hospital per our designation as Long Term Acute. Therefore our length of stay is much longer than a regular Short Term Hospital.

In addition, our patient mix is predominately elderly as they most often have more serious illnesses with more frequent secondary problems. Subsequently they require a longer hospital stay than the younger population.

Submission Timing

Baylor estimates that our data volumes for the calendar year time period submitted may include 96% to 100% of all cases for that time period. The state requires us to submit a snapshot of billed claims, extracted from our database approximately 20 days following the close of the calendar year quarter. Any discharged patient encounters not billed by this cut-off date will not be included in the quarterly submission file sent in.

Physician Identification

All physician license numbers and names have been validated as accurate against a physician reference file that is derived from information provided by the Texas Board of Medical Examiners. Those physicians not yet assigned

Hospital Comments, 3Q2005

a state license number at the time of data submission are given temporary numbers by the hospital for state reporting purposes. Due to the "lag" time between when the physician is licensed and when THCIC receives the information, some physicians may remain unidentified in the THCIC Practitioner Reference Files.

The THCIC minimum data set houses only two (2) physician fields; Attending Physician and Operating or Other Physician (if applicable) as reflected on the UB92 billing document. Mortality rates, case costs and other data calculated for this population of physicians may be misrepresentative. Due to the complexity of most inpatient admissions many physicians provide care to patients throughout an admission. Consulting physicians may prescribe and treat patients on behalf of the physician listed as the attending physician. Analysis of this physician information should carefully consider that significant variations in case count, case cost, and mortality may not be directly related to the care provided by the attending physician, but also reflect the varied use of consultants.

While hospitals document many treating physicians (surgeons and consultants) for each case, THCIC maintains only one (1) additional physician per case besides the Attending. "Other" physician case volumes, mortality, case costs and LOS, will frequently be inaccurate because of this limitation. Surgeons and consulting physicians beyond one that may have been involved on a case will not be credited with providing care for that patient. Analysis of "other physician" information should, therefore, take into consideration that a significant portion of treating physicians are excluded from the patient cases.

Diagnosis and Procedures

Patient diagnoses and procedures for a particular hospital stay are coded by the hospital using a universal standard called the International Classification of Disease, or ICD-9-CM. This is mandated by the federal government and all hospitals must comply.

The codes are assigned based on documentation in the patient's chart and are used by hospitals for billing purposes. The hospital can code as many as 25 diagnoses and 25 procedures for each patient record. One limitation of using the ICD-9-CM system is that there does not exist a code for every possible diagnosis and procedure due to the continued evolution of medicine; new codes are added yearly as coding manuals are updated.

Race/Ethnicity

There are no national standards regarding patient race categorization so hospitals may not have the same designations from which patients can choose. The state has recently attempted to standardize a valid set of race codes for this project but these are not universally used by all hospitals. Each hospital must independently map their specific codes to the state's race code categories. This mapping may not be consistent across hospitals. Thus epidemiology analysis of these two data fields does not accurately describe the true population served by the hospital.

Standard Source of Payment

The standard source of payment codes are an example of data required by the state that is not contained within the standard UB92 billing record. In order to meet this requirement each payer identification must be categorized into the appropriate standard source of payment value. It should also be noted that the primary payer associated to the patient's encounter record may change over time. With this in mind, approximately 9% of the primary payers originally categorized as "Blue Cross" were recategorized as "Managed Care", 39% of "Commercial" were recategorized as "Managed Care" and 6% originally categorized as "Blue Cross" were recategorized as "Medicare". Also, approximately 8% of the secondary payers originally categorized as "Blue Cross" were recategorized as "Missing/Invalid", 7%

Hospital Comments, 3Q2005

originally categorized as "Commercial" were recategorized as "Managed Care" and 5% originally categorized as "Commercial" were recategorized as "Self-Pay".

Additionally, those payers identified contractually as both "HMO and PPO" are categorized as "Commercial PPO". Thus any true managed care comparisons by contract type (HMO vs. PPO) may result in inaccurate analysis.

Cost/ Revenue Codes

The state requires that hospitals submit revenue information including charges. It is important to note that charges are not equal to actual payments received by the hospital or hospital cost for performing the service. Typically actual payments are much less than charges due to managed care-negotiated discounts and denial of payment by insurance companies. Charges also do not reflect the actual cost to deliver the care that each patient needs.

Certification Process

Given the current certification software, there is not an efficient mechanism to edit and correct the data. In addition, due to hospital volumes, it is not feasible to perform encounter level audits and edits. Within the constraints of the current THCIC process, the data is certified to the best of our knowledge as accurate and complete given the above comments.
